[41272] VGAM1146 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1146 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1146 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[41273] The complementary binding of VGAM1146 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1146 host target RNA into VGAM1146 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41274] It is appreciated that VGAM1146 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1146 host target genes. The mRNA of each one of this plurality of VGAM1146 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1146 RNA, herein designated VGAM RNA, and which when bound by VGAM1146 RNA causes inhibition of translation of respective one or more VGAM1146 host target proteins.

[41275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1146 gene, herein designated VGAM GENE, on one

or more VGAM1146 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41276] It is yet further appreciated that a function of VGAM1146 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1146 correlate with, and may be deduced from, the identity of the host target genes which VGAM1146 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41277] Nucleotide sequences of the VGAM1146 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1146 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1146 are further described hereinbelow with reference to Table 1.

[41278] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1146 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1146 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41279] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1146 gene, herein designated VGAM is inhibition of expression of VGAM1146 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1146 correlate with, and may be deduced from, the identity of the target genes which VGAM1146 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41280] ACT (Accession NM_020482) is a VGAM1146 host target

gene. ACT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACT BINDING SITE, designated SEQ ID:21735, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41281] A function of VGAM1146 is therefore inhibition of ACT (Accession NM_020482), a gene which a plasma protease inhibitor synthesized in the liver. Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACT. The function of ACT has been established by previous studies. Alpha-1-antichymotrypsin is a plasma protease inhibitor synthesized in the liver. It is a single glycopeptide chain of about 68,000 daltons and belongs to the class of serine protease inhibitors. In man, the normal serum level is about one-tenth that of alpha-1-antitrypsin (PI; 107400), with which it shares nucleic acid and protein sequence homology (Chandra et al., 1983). Both are major acute phase reactants; their concentrations in plasma increase in response to trauma, surgery, and infection. An-

tithrombin III, which also is structurally similar to alpha-1-antitrypsin, shows less sequence homology to antichymotrypsin and is not an acute phase reactant. Sefton et al. (1990) concluded that the PI-PIL gene cluster is only 220 kb away from the AACT gene and that it is oriented in the opposite direction. (PIL refers to 'PI-like' and is also referred to as 'antitrypsin-related,' or ATR (OMIM Ref. No. 107410).) The comparatively short interval between the genes came as a surprise given previous estimates of the level of genetic recombination between them. By PCR-single strand conformation polymorphism (SSCP) analysis, Tsuda et al. (1992) identified a point mutation in exon 5 of the AACT gene resulting in substitution of met by val at codon 389. The mutation, an A-to-G transition at base-pair 1252, was found in heterozygous state in 6 patients; 4 of the 6 (aged 38, 43, 69, and 80 years) had occlusive cerebrovascular disease.

[41282] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41283] Chandra, T.; Stackhouse, R.; Kidd, V. J.; Robson, K. J. H.; Woo, S. L. C. : Sequence homology between human alpha-1-antichymotrypsin, alpha-1-antitrypsin, and antithrom-

bin III. Biochemistry 22: 5055–5061, 1983. ; and

[41284] Tsuda, M.; Sei, Y.; Yamamura, M.; Yamamoto, M.; Shino-
hara, Y. : Detection of a new mutant alpha-
1-antichymotrypsin in patients with occlusive-
cerebrovascular disease. FEBS Lett. 304: 66.

[41285] Further studies establishing the function and utilities of
ACT are found in John Hopkins OMIM database record ID
107280, and in cited publications numbered
12428–12442, 78 and 833–839 listed in the bibliography
section hereinbelow, which are also hereby incorporated
by reference. Breast Cancer 1, Early Onset (BRCA1, Acces-
sion NM_007294) is another VGAM1146 host target gene.
BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10 are
HOST TARGET binding sites found in untranslated regions
of mRNA encoded by BRCA1, corresponding to HOST
TARGET binding sites such as BINDING SITE I, BINDING
SITE II or BINDING SITE III. Table 2 illustrates the comple-
mentarity of the nucleotide sequences of BRCA1 BINDING
SITE1 through BRCA1 BINDING SITE10, designated SEQ
ID:14161, SEQ ID:14167, SEQ ID:14173, SEQ ID:14179,
SEQ ID:14186, SEQ ID:14192, SEQ ID:14198, SEQ
ID:14206, SEQ ID:14212 and SEQ ID:14218 respectively,
to the nucleotide sequence of VGAM1146 RNA, herein

designated VGAM RNA, also designated SEQ ID:3857.

[41286] Another function of VGAM1146 is therefore inhibition of Breast Cancer 1, Early Onset (BRCA1, Accession NM_007294). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NM_032983) is another VGAM1146 host target gene. CASP2 BINDING SITE1 through CASP2 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE1 through CASP2 BINDING SITE4, designated SEQ ID:26857, SEQ ID:26862, SEQ ID:6889 and SEQ ID:6998 respectively, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41287] Another function of VGAM1146 is therefore inhibition of Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-reg-

ulated 2) (CASP2, Accession NM_032983), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2. The function of CASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM148. Homeo Box A7 (HOXA7, Accession NM_006896) is another VGAM1146 host target gene. HOXA7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXA7 BINDING SITE, designated SEQ ID:13770, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41288] Another function of VGAM1146 is therefore inhibition of Homeo Box A7 (HOXA7, Accession NM_006896), a gene which provides cells with specific positional identities on the anterior–posterior axis. Accordingly, utilities of

VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA7. The function of HOXA7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Interleukin 12B (natural killer cell stimulatory factor 2, cytotoxic lymphocyte maturation factor 2, p40) (IL12B, Accession NM_002187) is another VGAM1146 host target gene. IL12B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL12B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL12B BINDING SITE, designated SEQ ID:7942, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41289] Another function of VGAM1146 is therefore inhibition of Interleukin 12B (natural killer cell stimulatory factor 2, cytotoxic lymphocyte maturation factor 2, p40) (IL12B, Accession NM_002187). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL12B. Myeloid/

lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 3 (MLLT3, Accession NM_004529) is another VGAM1146 host target gene. MLLT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT3 BINDING SITE, designated SEQ ID:10871, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41290] Another function of VGAM1146 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 3 (MLLT3, Accession NM_004529), a gene which is Serine and proline rich protein. Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT3. The function of MLLT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM67.Nephroblastoma Overexpressed Gene (NOV, Ac-

cession NM_002514) is another VGAM1146 host target gene. NOV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NOV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOV BINDING SITE, designated SEQ ID:8346, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41291] Another function of VGAM1146 is therefore inhibition of Nephroblastoma Overexpressed Gene (NOV, Accession NM_002514), a gene which is likely to play a role in cell growth regulation . Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOV. The function of NOV has been established by previous studies. The avian nephroblastoma induced by myeloblastosis-associated virus (MAV) is a good model of Wilms tumor because of histologic similarities. Soret et al. (1989) and Joliot et al. (1992) identified in MAV-1-induced avian nephroblastoma a new protooncogene they called nov for nephroblastoma overexpressed gene. Martinerie and Perbal (1991) found that human sequences homologous to nov were

expressed in normal hematopoietic cells and in 1 nephroblastoma. By a combination of study of somatic cell hybrids and in situ hybridization, Martinerie et al. (1992) showed that the human homolog maps to 8q24.1, proximal to MYC (OMIM Ref. No. 190080). Snaith et al. (1996) stated that the NOV gene encodes a cysteine-rich protein that is overexpressed in avian nephroblastomas. It is a member of the CCN family of proteins that includes connective tissue growth factor (OMIM Ref. No. 121009). These proteins are encoded by a group of genes known as immediate-early genes, so named because they are expressed after induction by growth factors or certain oncogenes. The proteins share several common structural motifs: a consensus sequence present in IGF (insulin-like growth factor)-binding proteins (the IGFBP motif), an oligomeric complex-forming domain first identified in von Willebrand factor (VWF; 193400), a binding domain to soluble and matrix molecules, and a dimerization (CT) domain (Bork, 1993). All CCN family members are thought to be involved in the control of cell proliferation. Snaith et al. (1996) isolated and characterized genomic and cDNA clones encompassing the mouse nov gene. It is highly conserved with the human and chick nov genes at the

level of nucleotide sequence and genomic organization.

The exon structure reflected the modular organization of NOV protein in a number of structural domains. These are highly conserved with other members of the CCN family, as is the distribution of 38 of its 40 cysteine residues.

Snaith et al. (1996) mapped the nov gene to mouse chromosome 15 in a region of conserved synteny with human chromosome 8.

[41292] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41293] Martinerie, C.; Perbal, B. : Expression of a gene encoding a novel potential IGF binding protein in human tissues. C. R. Acad. Sci. (Paris) 313 (ser. 3): 345–351, 1991. ; and

[41294] Snaith, M. R.; Natarajan, D.; Taylor, L. B.; Choi, C.-P.; Martinerie, C.; Perbal, B.; Schofield, P. N.; Boulter, C. A. : Genomic structure and chromosomal mapping of the mouse nov gene.

[41295] Further studies establishing the function and utilities of NOV are found in John Hopkins OMIM database record ID 164958, and in cited publications numbered 10803, 10805–1080 and 11959–10809 listed in the bibliography section hereinbelow, which are also hereby incorporated

by reference. Profilin 2 (PFN2, Accession NM_053024) is another VGAM1146 host target gene. PFN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFN2 BINDING SITE, designated SEQ ID:27582, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41296] Another function of VGAM1146 is therefore inhibition of Profilin 2 (PFN2, Accession NM_053024). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFN2. Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_020472) is another VGAM1146 host target gene. PIGA BINDING SITE1 through PIGA BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIGA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGA BINDING SITE1

through PIGA BINDING SITE3, designated SEQ ID:21712, SEQ ID:21719 and SEQ ID:8499 respectively, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41297] Another function of VGAM1146 is therefore inhibition of Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_020472). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGA. Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579) is another VGAM1146 host target gene. CCR5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR5 BINDING SITE, designated SEQ ID:6183, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41298] Another function of VGAM1146 is therefore inhibition of Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579). Accordingly, utilities of VGAM1146 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR5. Calsyntenin 2 (CLSTN2, Accession NM_022131) is another VGAM1146 host target gene. CLSTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLSTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN2 BINDING SITE, designated SEQ ID:22693, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41299] Another function of VGAM1146 is therefore inhibition of Calsyntenin 2 (CLSTN2, Accession NM_022131). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLSTN2. CPR2 (Accession NM_030900) is another VGAM1146 host target gene. CPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPR2 BIND-

ING SITE, designated SEQ ID:25176, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41300] Another function of VGAM1146 is therefore inhibition of CPR2 (Accession NM_030900). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPR2. MGC4730 (Accession XM_034644) is another VGAM1146 host target gene. MGC4730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4730 BINDING SITE, designated SEQ ID:32133, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41301] Another function of VGAM1146 is therefore inhibition of MGC4730 (Accession XM_034644). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4730. ODZ2 (Accession XM_047995) is another VGAM1146 host target gene. ODZ2 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by ODZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODZ2 BINDING SITE, designated SEQ ID:35097, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41302] Another function of VGAM1146 is therefore inhibition of ODZ2 (Accession XM_047995). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ODZ2. TA-KRP (Accession NM_032505) is another VGAM1146 host target gene. TA-KRP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TA-KRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TA-KRP BINDING SITE, designated SEQ ID:26254, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41303] Another function of VGAM1146 is therefore inhibition of

TA-KRP (Accession NM_032505). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-KRP. WD Repeat Domain 7 (WDR7, Accession NM_015285) is another VGAM1146 host target gene. WDR7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR7 BINDING SITE, designated SEQ ID:17611, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41304] Another function of VGAM1146 is therefore inhibition of WD Repeat Domain 7 (WDR7, Accession NM_015285). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR7. LOC154739 (Accession XM_098602) is another VGAM1146 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41721, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41305] Another function of VGAM1146 is therefore inhibition of LOC154739 (Accession XM_098602). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC158401 (Accession XM_088568) is another VGAM1146 host target gene. LOC158401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158401 BINDING SITE, designated SEQ ID:39837, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41306] Another function of VGAM1146 is therefore inhibition of LOC158401 (Accession XM_088568). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158401. LOC90488 (Accession XM_032129) is another VGAM1146 host target gene. LOC90488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90488 BINDING SITE, designated SEQ ID:31559, to the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, also designated SEQ ID:3857.

[41307] Another function of VGAM1146 is therefore inhibition of LOC90488 (Accession XM_032129). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90488. LOC91115 (Accession XM_036218) is another VGAM1146 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32403, to the nucleotide sequence of VGAM1146 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3857.

[41308] Another function of VGAM1146 is therefore inhibition of LOC91115 (Accession XM_036218). Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1147 (VGAM1147) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41309] VGAM1147 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1147 was detected is described hereinabove with reference to Figs. 1–8.

[41310] VGAM1147 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1147 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41311] VGAM1147 gene encodes a VGAM1147 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1147 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1147 precursor RNA is designated SEQ ID:1133, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1133 is located at position 216748 relative to the genome of Fowlpox Virus.

- [41312] VGAM1147 precursor RNA folds onto itself, forming VGAM1147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [41313] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1147 folded precursor RNA into VGAM1147 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1147 RNA is designated SEQ ID:3858, and is provided hereinbelow with reference to the sequence listing part.

[41314] VGAM1147 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1147 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41315] VGAM1147 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1147 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1147 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[41316] The complementary binding of VGAM1147 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1147 host target RNA into VGAM1147 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41317] It is appreciated that VGAM1147 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1147 host target genes. The mRNA of

each one of this plurality of VGAM1147 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1147 RNA, herein designated VGAM RNA, and which when bound by VGAM1147 RNA causes inhibition of translation of respective one or more VGAM1147 host target proteins.

[41318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1147 gene, herein designated VGAM GENE, on one or more VGAM1147 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[41319] It is yet further appreciated that a function of VGAM1147 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1147 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1147 correlate with, and may be deduced from, the identity of the host target genes which VGAM1147 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41320] Nucleotide sequences of the VGAM1147 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1147 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1147 are further described hereinbelow with reference to Table 1.

[41321] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1147 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1147 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41322] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1147 gene, herein designated VGAM is inhibition of expression of VGAM1147 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1147 correlate with, and may be deduced from, the identity of the target genes which VGAM1147 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41323] Holocarboxylase Synthetase

(biotin-[propionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411) is a VGAM1147 host target gene. HLCS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HLCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:5988, to the nucleotide sequence of VGAM1147 RNA, herein designated VGAM RNA, also designated SEQ ID:3858.

[41324] A function of VGAM1147 is therefore inhibition of Holo-

carboxylase Synthetase (biotin-[propionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM_000411). Accordingly, utilities of VGAM1147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS. Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326) is another VGAM1147 host target gene. TNFSF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF4 BINDING SITE, designated SEQ ID:9327, to the nucleotide sequence of VGAM1147 RNA, herein designated VGAM RNA, also designated SEQ ID:3858.

[41325] Another function of VGAM1147 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM_003326), a gene which co-stimulates t cell proliferation and cytokine production. Accordingly, utilities of VGAM1147 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with TNFSF4. The function of TNFSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM463.FLJ23511 (Accession NM_032239) is another VGAM1147 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25969, to the nucleotide sequence of VGAM1147 RNA, herein designated VGAM RNA, also designated SEQ ID:3858.

[41326] Another function of VGAM1147 is therefore inhibition of FLJ23511 (Accession NM_032239). Accordingly, utilities of VGAM1147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. LOC120196 (Accession XM_061916) is another VGAM1147 host target gene. LOC120196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120196, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120196 BINDING SITE, designated SEQ ID:37218, to the nucleotide sequence of VGAM1147 RNA, herein designated VGAM RNA, also designated SEQ ID:3858.

[41327] Another function of VGAM1147 is therefore inhibition of LOC120196 (Accession XM_061916). Accordingly, utilities of VGAM1147 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120196. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1148 (VGAM1148) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41328] VGAM1148 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1148 was detected is described hereinabove with reference to Figs. 1-8.

[41329] VGAM1148 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Her-

pesvirus 7. VGAM1148 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41330] VGAM1148 gene encodes a VGAM1148 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1148 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1148 precursor RNA is designated SEQ ID:1134, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1134 is located at position 73086 relative to the genome of Cercopithecine Herpesvirus 7.

[41331] VGAM1148 precursor RNA folds onto itself, forming VGAM1148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41332] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1148 folded precursor RNA into VGAM1148 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1148 RNA is designated SEQ ID:3859, and is provided hereinbelow with reference to the sequence listing part.

[41333] VGAM1148 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1148 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41334] VGAM1148 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1148 RNA is an accurate or a partial inversed–reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1148 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41335] The complementary binding of VGAM1148 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1148 host target RNA into VGAM1148 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41336] It is appreciated that VGAM1148 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1148 host target genes. The mRNA of each one of this plurality of VGAM1148 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1148 RNA, herein designated VGAM RNA, and which when bound by VGAM1148 RNA causes inhibition of translation of respective one or more VGAM1148 host target proteins.

[41337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1148 gene, herein designated VGAM GENE, on one or more VGAM1148 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41338] It is yet further appreciated that a function of VGAM1148 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1148 correlate with, and may be deduced from, the identity of the host target genes which VGAM1148 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41339] Nucleotide sequences of the VGAM1148 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1148 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1148 are further described hereinbelow with reference to Table 1.

[41340] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1148 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1148 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41341] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1148 gene, herein designated VGAM is inhibition of expression of VGAM1148 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1148 correlate with, and may be deduced from, the identity of the target genes which VGAM1148 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41342] Disabled Homolog 2, Mitogen-responsive Phosphoprotein (Drosophila) (DAB2, Accession NM_001343) is a VGAM1148 host target gene. DAB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAB2 BINDING SITE,

designated SEQ ID:7023, to the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, also designated SEQ ID:3859.

[41343] A function of VGAM1148 is therefore inhibition of Disabled Homolog 2, Mitogen-responsive Phosphoprotein (Drosophila) (DAB2, Accession NM_001343), a gene which may be a component of the csf-1 signal transduction pathway. Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAB2. The function of DAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM659.FLJ11269 (Accession XM_052193) is another VGAM1148 host target gene. FLJ11269 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11269, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11269 BINDING SITE, designated SEQ ID:35955, to the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, also designated SEQ ID:3859.

[41344] Another function of VGAM1148 is therefore inhibition of FLJ11269 (Accession XM_052193). Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11269. KIAA0016 (Accession NM_014765) is another VGAM1148 host target gene. KIAA0016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0016 BINDING SITE, designated SEQ ID:16536, to the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, also designated SEQ ID:3859.

[41345] Another function of VGAM1148 is therefore inhibition of KIAA0016 (Accession NM_014765). Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0016. KIAA1431 (Accession XM_032055) is another VGAM1148 host target gene. KIAA1431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1431, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1431 BINDING SITE, designated SEQ ID:31551, to the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, also designated SEQ ID:3859.

[41346] Another function of VGAM1148 is therefore inhibition of KIAA1431 (Accession XM_032055). Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1431. Protocadherin 19 (PCDH19, Accession XM_033173) is another VGAM1148 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31866, to the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, also designated SEQ ID:3859.

[41347] Another function of VGAM1148 is therefore inhibition of Protocadherin 19 (PCDH19, Accession XM_033173). Accordingly, utilities of VGAM1148 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with PCDH19. LOC221300 (Accession XM_166322) is another VGAM1148 host target gene. LOC221300 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221300 BINDING SITE, designated SEQ ID:44150, to the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, also designated SEQ ID:3859.

[41348] Another function of VGAM1148 is therefore inhibition of LOC221300 (Accession XM_166322). Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221300. LOC222499 (Accession XM_169457) is another VGAM1148 host target gene. LOC222499 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC222499 BINDING SITE, designated SEQ ID:45303, to the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, also designated SEQ ID:3859.

[41349] Another function of VGAM1148 is therefore inhibition of LOC222499 (Accession XM_169457). Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222499. LOC90321 (Accession XM_030896) is another VGAM1148 host target gene. LOC90321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90321 BINDING SITE, designated SEQ ID:31210, to the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, also designated SEQ ID:3859.

[41350] Another function of VGAM1148 is therefore inhibition of LOC90321 (Accession XM_030896). Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90321. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1149 (VGAM1149) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41351] VGAM1149 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1149 was detected is described hereinabove with reference to Figs. 1–8.

[41352] VGAM1149 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1149 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41353] VGAM1149 gene encodes a VGAM1149 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1149 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1149 precursor RNA is designated SEQ ID:1135, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1135 is located at position 75465 relative to the

genome of Cercopithecine Herpesvirus 7.

[41354] VGAM1149 precursor RNA folds onto itself, forming VGAM1149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41355] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1149 folded precursor RNA into VGAM1149 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1149 RNA is designated SEQ ID:3860, and is provided hereinbelow with reference to the sequence listing part.

[41356] VGAM1149 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1149 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41357] VGAM1149 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1149 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1149 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[41358] The complementary binding of VGAM1149 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1149 host target RNA into VGAM1149 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41359] It is appreciated that VGAM1149 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1149 host target genes. The mRNA of each one of this plurality of VGAM1149 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1149 RNA, herein designated VGAM RNA, and which when bound by VGAM1149 RNA causes inhibition of translation of respective one or more VGAM1149 host target proteins.

[41360] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1149 gene, herein designated VGAM GENE, on one or more VGAM1149 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41361] It is yet further appreciated that a function of VGAM1149 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1149 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of

VGAM1149 correlate with, and may be deduced from, the identity of the host target genes which VGAM1149 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41362] Nucleotide sequences of the VGAM1149 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1149 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1149 are further described hereinbelow with reference to Table 1.

[41363] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1149 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1149 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41364] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1149 gene, herein designated VGAM is inhibition of expression of VGAM1149 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1149 correlate with, and may be deduced

from, the identity of the target genes which VGAM1149 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41365] Lipoprotein Lipase (LPL, Accession NM_000237) is a VGAM1149 host target gene. LPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPL BINDING SITE, designated SEQ ID:5747, to the nucleotide sequence of VGAM1149 RNA, herein designated VGAM RNA, also designated SEQ ID:3860.

[41366] A function of VGAM1149 is therefore inhibition of Lipoprotein Lipase (LPL, Accession NM_000237), a gene which is the hydrolysis of triglycerides of circulating chylomicrons and very low density lipoproteins (vldl). the enzyme functions in the presence of apolipoprotein c-2 on the luminal surface of vascular. Accordingly, utilities of VGAM1149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPL. The function of LPL and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM55.Dicer1, Dcr-1 Homolog (Drosophila) (DICER1, Accession NM_030621) is another VGAM1149 host target gene. DICER1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DICER1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DICER1 BINDING SITE, designated SEQ ID:24963, to the nucleotide sequence of VGAM1149 RNA, herein designated VGAM RNA, also designated SEQ ID:3860.

[41367] Another function of VGAM1149 is therefore inhibition of Dicer1, Dcr-1 Homolog (Drosophila) (DICER1, Accession NM_030621). Accordingly, utilities of VGAM1149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DICER1. FLJ11040 (Accession NM_018307) is another VGAM1149 host target gene. FLJ11040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ11040 BINDING SITE, designated SEQ ID:20294, to the nucleotide sequence of VGAM1149 RNA, herein designated VGAM RNA, also designated SEQ ID:3860.

[41368] Another function of VGAM1149 is therefore inhibition of FLJ11040 (Accession NM_018307). Accordingly, utilities of VGAM1149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11040. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_020552) is another VGAM1149 host target gene. TCL6 BINDING SITE1 through TCL6 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 through TCL6 BINDING SITE4, designated SEQ ID:21770, SEQ ID:21761, SEQ ID:14843 and SEQ ID:15767 respectively, to the nucleotide sequence of VGAM1149 RNA, herein designated VGAM RNA, also designated SEQ ID:3860.

[41369] Another function of VGAM1149 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession

NM_020552). Accordingly, utilities of VGAM1149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC253747 (Accession XM_173619) is another VGAM1149 host target gene. LOC253747 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253747 BINDING SITE, designated SEQ ID:46551, to the nucleotide sequence of VGAM1149 RNA, herein designated VGAM RNA, also designated SEQ ID:3860.

[41370] Another function of VGAM1149 is therefore inhibition of LOC253747 (Accession XM_173619). Accordingly, utilities of VGAM1149 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253747. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1150 (VGAM1150) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[41371] VGAM1150 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1150 was detected is described hereinabove with reference to Figs. 1–8.

[41372] VGAM1150 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1150 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41373] VGAM1150 gene encodes a VGAM1150 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1150 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1150 precursor RNA is designated SEQ ID:1136, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1136 is located at position 76231 relative to the genome of Cercopithecine Herpesvirus 7.

[41374] VGAM1150 precursor RNA folds onto itself, forming VGAM1150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41375] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1150 folded precursor RNA into VGAM1150 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1150 RNA is designated SEQ ID:3861, and is provided hereinbelow with reference to the sequence listing part.

[41376] VGAM1150 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1150 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[41377] VGAM1150 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1150 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1150 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[41378] The complementary binding of VGAM1150 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1150 host target RNA into VGAM1150 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41379] It is appreciated that VGAM1150 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1150 host target genes. The mRNA of each one of this plurality of VGAM1150 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1150 RNA, herein designated VGAM RNA, and which when bound by VGAM1150 RNA causes inhibition of translation of respective one or more VGAM1150 host target proteins.

[41380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1150 gene, herein designated VGAM GENE, on one

or more VGAM1150 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41381] It is yet further appreciated that a function of VGAM1150 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1150 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1150 correlate with, and may be deduced from, the identity of the host target genes which VGAM1150 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41382] Nucleotide sequences of the VGAM1150 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1150 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1150 are further described hereinbelow with reference to Table 1.

[41383] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1150 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1150 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41384] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1150 gene, herein designated VGAM is inhibition of expression of VGAM1150 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1150 correlate with, and may be deduced from, the identity of the target genes which VGAM1150 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41385] Integrin, Beta 1 (fibronectin receptor, beta polypeptide,

antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_002211) is a VGAM1150 host target gene. ITGB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB1 BINDING SITE, designated SEQ ID:7977, to the nucleotide sequence of VGAM1150 RNA, herein designated VGAM RNA, also designated SEQ ID:3861.

[41386] A function of VGAM1150 is therefore inhibition of Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_002211), a gene which acts as a fibronectin receptor. Accordingly, utilities of VGAM1150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB1. The function of ITGB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM427. Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181) is another VGAM1150 host target gene. LRAT BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by LRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRAT BINDING SITE, designated SEQ ID:30182, to the nucleotide sequence of VGAM1150 RNA, herein designated VGAM RNA, also designated SEQ ID:3861.

[41387] Another function of VGAM1150 is therefore inhibition of Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181). Accordingly, utilities of VGAM1150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRAT. FLJ20281 (Accession XM_165663) is another VGAM1150 host target gene. FLJ20281 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20281 BINDING SITE, designated SEQ ID:43728, to the nucleotide sequence of VGAM1150 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3861.

[41388] Another function of VGAM1150 is therefore inhibition of FLJ20281 (Accession XM_165663). Accordingly, utilities of VGAM1150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20281. RP4-622L5 (Accession NM_019118) is another VGAM1150 host target gene. RP4-622L5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP4-622L5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP4-622L5 BINDING SITE, designated SEQ ID:21200, to the nucleotide sequence of VGAM1150 RNA, herein designated VGAM RNA, also designated SEQ ID:3861.

[41389] Another function of VGAM1150 is therefore inhibition of RP4-622L5 (Accession NM_019118). Accordingly, utilities of VGAM1150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP4-622L5. LOC129566 (Accession XM_065294) is another VGAM1150 host target gene. LOC129566 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129566, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129566 BINDING SITE, designated SEQ ID:37280, to the nucleotide sequence of VGAM1150 RNA, herein designated VGAM RNA, also designated SEQ ID:3861.

[41390] Another function of VGAM1150 is therefore inhibition of LOC129566 (Accession XM_065294). Accordingly, utilities of VGAM1150 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129566. LOC154386 (Accession XM_087920) is another VGAM1150 host target gene. LOC154386 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154386 BINDING SITE, designated SEQ ID:39472, to the nucleotide sequence of VGAM1150 RNA, herein designated VGAM RNA, also designated SEQ ID:3861.

[41391] Another function of VGAM1150 is therefore inhibition of LOC154386 (Accession XM_087920). Accordingly, utilities of VGAM1150 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC154386. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1151 (VGAM1151) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41392] VGAM1151 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1151 was detected is described hereinabove with reference to Figs. 1–8.

[41393] VGAM1151 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1151 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41394] VGAM1151 gene encodes a VGAM1151 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1151 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1151 precursor RNA is desig-

nated SEQ ID:1137, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1137 is located at position 2018 relative to the genome of Cowpox Virus.

- [41395] VGAM1151 precursor RNA folds onto itself, forming VGAM1151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [41396] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1151 folded precursor RNA into VGAM1151 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1151 RNA is designated SEQ ID:3862, and is provided hereinbelow with reference to the sequence

listing part.

[41397] VGAM1151 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1151 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41398] VGAM1151 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1151 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1151 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41399] The complementary binding of VGAM1151 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1151 host target RNA into VGAM1151 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41400] It is appreciated that VGAM1151 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1151 host target genes. The mRNA of each one of this plurality of VGAM1151 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1151 RNA, herein designated VGAM

RNA, and which when bound by VGAM1151 RNA causes inhibition of translation of respective one or more VGAM1151 host target proteins.

[41401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1151 gene, herein designated VGAM GENE, on one or more VGAM1151 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41402] It is yet further appreciated that a function of VGAM1151 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1151 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1151 correlate with, and may be deduced from, the identity of the host target genes which VGAM1151 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41403] Nucleotide sequences of the VGAM1151 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1151 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1151 are further described hereinbelow with reference to Table 1.

[41404] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1151 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1151 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41405] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1151 gene, herein designated VGAM is

inhibition of expression of VGAM1151 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1151 correlate with, and may be deduced from, the identity of the target genes which VGAM1151 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41406] 1-acylglycerol-3-phosphate O-acyltransferase 2 (lysophosphatidic acid acyltransferase, beta) (AGPAT2, Accession NM_006412) is a VGAM1151 host target gene. AGPAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AGPAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT2 BINDING SITE, designated SEQ ID:13120, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41407] A function of VGAM1151 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 2 (lysophosphatidic acid acyltransferase, beta) (AGPAT2, Accession NM_006412). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with AGPAT2. Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM_042963) is another VGAM1151 host target gene. ARHGEF6 BINDING SITE1 and ARHGEF6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARHGEF6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF6 BINDING SITE1 and ARHGEF6 BINDING SITE2, designated SEQ ID:33846 and SEQ ID:33847 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41408] Another function of VGAM1151 is therefore inhibition of Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM_042963). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF6. Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458) is another VGAM1151 host target gene. BSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BSN, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE, designated SEQ ID:9517, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41409] Another function of VGAM1151 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSN. The function of BSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM638. Dihydropyrimidinase-like 2 (DPYSL2, Accession NM_001386) is another VGAM1151 host target gene. DPYSL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DPYSL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL2 BINDING SITE, designated SEQ

ID:7063, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41410] Another function of VGAM1151 is therefore inhibition of Dihydropyrimidinase-like 2 (DPYSL2, Accession NM_001386), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL2. The function of DPYSL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Enolase 2, (gamma, neuronal) (ENO2, Accession NM_001975) is another VGAM1151 host target gene. ENO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENO2 BINDING SITE, designated SEQ ID:7706, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41411] Another function of VGAM1151 is therefore inhibition of

Enolase 2, (gamma, neuronal) (ENO2, Accession NM_001975), a gene which converts 2-phospho-D-glycerate to phosphoenolpyruvate in glycolysis. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENO2. The function of ENO2 has been established by previous studies. The enolases (phosphopyruvate hydratase; EC 4.2.1.11) catalyze the interconversion of 2-phosphoglycerate to phosphoenolpyruvate in the glycolytic pathway. The functional enzyme is a dimer made up of subunits referred to as alpha, beta, and gamma. In mammals there are at least 3 isoforms of enolase characterized by different tissue distributions as well as by distinct biochemical and immunologic properties. The alpha-, or nonneuronal, enolase (ENO1; 172430) is a nearly ubiquitous form, found in almost all tissues, and its expression precedes that of the other isoforms in the early stage of embryonic development. The beta-, or muscle-specific, enolase (ENO3; 131370) is present in adult skeletal muscle, and the gamma-, or neuron-specific, enolase (ENO2) is the major form found in mature neurons and in cells of neuronal origin. Enolase-2 is determined by a gene on chromo-

some 12 (Grzeschik, 1976). Herbschleb-Voogt et al. (1978) confirmed assignment to chromosome 12 by showing synteny with LDHB and PEPB in man-mouse hybrids. Mattei et al. (1982) assigned ENO2 to 12p11-qter by study of cells trisomic for 12pter-p11. Law and Kao (1982) also assigned the gene to chromosome 12. By in situ hybridization, Craig et al. (1989, 1990) localized ENO2 to 12p13. Oliva et al. (1991) demonstrated that the ENO2 gene contains 12 exons distributed over 9,213 nucleotides. The putative promoter region lacks canonical TATA and CAAT boxes, is very G+C-rich, and contains several potential regulatory sequences.

[41412] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41413] Oliva, D.; Cali, L.; Feo, S.; Giallongo, A. : Complete structure of the human gene encoding neuron-specific enolase. *Genomics* 10: 157-165, 1991. ; and

[41414] Hinks, L. J.; Day, I. N. M. : Further studies of enolase loci. (Abstract) *Cytogenet. Cell Genet.* 58: 1854 only, 1991.

[41415] Further studies establishing the function and utilities of ENO2 are found in John Hopkins OMIM database record ID 131360, and in cited publications numbered 4575-4583

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FtsJ Homolog 2 (E. coli) (FTSJ2, Accession NM_013393) is another VGAM1151 host target gene. FTSJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FTSJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FTSJ2 BINDING SITE, designated SEQ ID:15044, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41416] Another function of VGAM1151 is therefore inhibition of FtsJ Homolog 2 (E. coli) (FTSJ2, Accession NM_013393). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FTSJ2. GAC1 (Accession NM_006338) is another VGAM1151 host target gene. GAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GAC1 BINDING SITE, designated SEQ ID:13037, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41417] Another function of VGAM1151 is therefore inhibition of GAC1 (Accession NM_006338). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAC1. Glutamate Dehydrogenase 1 (GLUD1, Accession NM_005271) is another VGAM1151 host target gene. GLUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUD1 BINDING SITE, designated SEQ ID:11774, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41418] Another function of VGAM1151 is therefore inhibition of Glutamate Dehydrogenase 1 (GLUD1, Accession NM_005271). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLUD1. Hyperpolarization

Activated Cyclic Nucleotide-gated Potassium Channel 4 (HCN4, Accession NM_005477) is another VGAM1151 host target gene. HCN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCN4 BINDING SITE, designated SEQ ID:11979, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41419] Another function of VGAM1151 is therefore inhibition of Hyperpolarization Activated Cyclic Nucleotide-gated Potassium Channel 4 (HCN4, Accession NM_005477), a gene which is hyperpolarization activated cyclic nucleotide-gated cation channel 4 and may act as a pacemaker channel in the heart . Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCN4. The function of HCN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.High Mobility Group AT-hook 2 (HMGA2, Ac-

cession NM_003483) is another VGAM1151 host target gene. HMGA2 BINDING SITE1 and HMGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HMGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE1 and HMGA2 BINDING SITE2, designated SEQ ID:9566 and SEQ ID:9567 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41420] Another function of VGAM1151 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Kinesin Family Member 3B (KIF3B, Accession NM_004798) is another VGAM1151 host

target gene. KIF3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF3B BINDING SITE, designated SEQ ID:11216, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41421] Another function of VGAM1151 is therefore inhibition of Kinesin Family Member 3B (KIF3B, Accession NM_004798), a gene which is a microtubule-based anterograde translocator for membranous organelles. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3B. The function of KIF3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1017. Lipoprotein Lipase (LPL, Accession NM_000237) is another VGAM1151 host target gene. LPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPL, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPL BINDING SITE, designated SEQ ID:5754, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41422] Another function of VGAM1151 is therefore inhibition of Lipoprotein Lipase (LPL, Accession NM_000237), a gene which is the hydrolysis of triglycerides of circulating chylomicrons and very low density lipoproteins (vldl). the enzyme functions in the presence of apolipoprotein c-2 on the luminal surface of vascular. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPL. The function of LPL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog (mouse) (MEIS1, Accession NM_002398) is another VGAM1151 host target gene. MEIS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEIS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MEIS1 BINDING SITE, designated SEQ ID:8218, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41423] Another function of VGAM1151 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog (mouse) (MEIS1, Accession NM_002398), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS1. The function of MEIS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894. Nuclear Factor I/A (NFIA, Accession XM_046827) is another VGAM1151 host target gene. NFIA BINDING SITE1 and NFIA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NFIA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFIA BINDING SITE1 and NFIA BINDING SITE2, designated SEQ ID:34841 and SEQ ID:34840 respectively, to the nu-

cleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41424] Another function of VGAM1151 is therefore inhibition of Nuclear Factor I/A (NFIA, Accession XM_046827). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIA. Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180) is another VGAM1151 host target gene. NTRK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:12843, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41425] Another function of VGAM1151 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with NTRK2. The function of NTRK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341. Paired Box Gene 5 (B-cell lineage specific activator protein) (PAX5, Accession NM_016734) is another VGAM1151 host target gene. PAX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX5 BINDING SITE, designated SEQ ID:18792, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41426] Another function of VGAM1151 is therefore inhibition of Paired Box Gene 5 (B-cell lineage specific activator protein) (PAX5, Accession NM_016734), a gene which plays a role in B-cell differentiation, neural development and spermatogenesis. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX5. The function of PAX5 has been established by previous studies. The PAX5

gene is located in the 9p13 region, which is involved in t(9;14)(p13;q32) translocations recurring in small lymphocytic lymphomas of the plasmacytoid subtype and in derived large cell lymphomas. Ohno et al. (1990) showed that in a diffuse large cell lymphoma (KIS-1) with a translocation, the immunoglobulin heavy-chain (IgH) locus on 14q32 is juxtaposed to 9p13 sequences of unknown function. Busslinger et al. (1996) showed that the KIS-1 translocation breakpoint is located 1,807 bp upstream of exon 1A of PAX5, thus bringing the potent E-mu enhancer of the IgH gene into close proximity with the PAX5 promoters. The data suggested to them that deregulation of PAX5 gene transcription by the t(9;14) translocation contributes to the pathogenesis of small lymphocytic lymphomas with plasmacytoid differentiation. In addition to immunoglobulin V genes, the 5-prime sequences of BCL6 (OMIM Ref. No. 109565) and FAS (TNFRSF6; 134637) are mutated in normal germinal center B lymphocytes. Genomic instability promotes tumorigenesis through defective chromosome segregation and DNA mismatch repair inactivation. By screening 18 loci for mutations, Pasqualucci et al. (2001) identified changes in the germline sequences of PIM1 (OMIM Ref. No. 164960), MYC

(OMIM Ref. No. 190080), ARHH (OMIM Ref. No. 602037), and/or PAX5, in addition to BCL6, in a majority of diffuse large cell lymphomas (DLCLs; OMIM Ref. No. 601889). No mutations in PIM1, MYC, ARHH, and PAX5 were detected in germinal-center lymphocytes, naive B cells, or B-cell malignancies other than DLCLs. PAX5 mutations, which were observed in 57% of DLCLs, were identified downstream of both transcription sites, predominantly in non-coding sequences around exon 1B. FISH analysis indicated that hypermutation in these genes is not due to chromosomal translocation, as seen in Burkitt lymphoma (OMIM Ref. No. 113970). Chromosomal translocation, however, may be an outcome of hypermutation. Specific features of the hypermutation process, including the predominance of single nucleotide substitutions with occasional deletions or duplications, a preference for transitions over transversions, and a specific motif targeting RGYW, were recognizable in each of the hypermutated loci.

Pasqualucci et al. (2001) proposed that aberrant hypermutation of regulatory and coding sequences of genes that do not represent physiologic targets may provide the basis for DLCL pathogenesis and explain its phenotypic and clinical heterogeneity. This hypermutation malfunc-

tion is unlikely to be due to defective DNA mismatch repair and does not appear to involve activation-induced deaminase (AICDA; 605257). Animal model experiments lend further support to the function of PAX5. Nutt et al. (1999) demonstrated that pro-B cells lacking Pax5 are incapable of in vitro B-cell differentiation unless Pax5 expression is restored by retroviral transduction. Pax5 $-/-$ pro-B cells are not restricted in their lineage fate, as stimulation with appropriate cytokines induces them to differentiate into functional macrophages, osteoclasts, dendritic cells, granulocytes, and natural killer cells. As expected for a clonogenic hematopoietic progenitor with lymphomyeloid developmental potential, the Pax5 $-/-$ pro-B cell expresses genes of different lineage-affiliated programs, and restoration of Pax5 activity represses this lineage-promiscuous transcription. Pax5 therefore plays an essential role in B-lineage commitment by suppressing alternative lineage choices. Differentiation of the hematopoietic stem cell into distinct blood cell types was thought to progress through intermediate progenitor cells with restricted developmental potential. This view of hematopoiesis was challenged by the findings of Nutt et al. (1999) that the Pax5 $-/-$ pro-B cell possesses, at least

under in vitro conditions, a broad, developmental potential similar to that of the hematopoietic stem cell itself. However, Pax5 $-/-$ pro-B cells are unable to differentiate along the erythroid and megakaryocytic lineages, and cannot reconstitute the entire hematopoietic system under transplantation experiments. Therefore, Nutt et al. (1999) concluded that the Pax5 $-/-$ pro-B cell must be classified as a hematopoietic progenitor cell with broad lymphoid and myeloid differentiation potential. Nutt et al. (1999) also concluded that their data supported the notion that B-lineage commitment is a stochastic rather than a deterministic process.

[41427] It is appreciated that the abovementioned animal model for PAX5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[41428] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41429] Pasqualucci, L.; Neumeister, P.; Goossens, T.; Nanjangud, G.; Chaganti, R. S. K.; Kuppers, R.; Dalla-Favera, R. : Hypermutation of multiple proto-oncogenes in B-cell diffuse large-cell lymphomas. Nature 412: 341–346, 2001. ; and

[41430] Nutt, S. L.; Heavey, B.; Rolink, A. G.; Busslinger, M. : Commitment to the B-lymphoid lineage depends on the transcription factor Pax5. Nature 401: 556–562, 1999.

[41431] Further studies establishing the function and utilities of PAX5 are found in John Hopkins OMIM database record ID 167414, and in cited publications numbered 10765–10770, 11110, 1077 and 10772–10773 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin Alpha 1 (PCDHA1, Accession NM_018900) is another VGAM1151 host target gene. PCDHA1 BINDING SITE1 through PCDHA1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 through PCDHA1 BINDING SITE4, designated SEQ ID:20866, SEQ ID:20869, SEQ ID:25385 and SEQ ID:25388 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41432] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM_018900).

Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM_031860) is another VGAM1151 host target gene. PCDHA10 BINDING SITE1 through PCDHA10 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 through PCDHA10 BINDING SITE4, designated SEQ ID:25620, SEQ ID:20876, SEQ ID:20879 and SEQ ID:20886 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41433] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM_031860). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin Alpha 12 (PCDHA12, Accession NM_018903) is another VGAM1151 host target gene. PCDHA12 BINDING SITE1 and PCDHA12 BINDING SITE2 are HOST TARGET binding

sites found in untranslated regions of mRNA encoded by PCDHA12, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA12 BINDING SITE1 and PCDHA12 BINDING SITE2, designated SEQ ID:20897 and SEQ ID:20900 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41434] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 12 (PCDHA12, Accession NM_018903). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA12. Protocadherin Alpha 13 (PCDHA13, Accession NM_018904) is another VGAM1151 host target gene. PCDHA13 BINDING SITE1 and PCDHA13 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA13, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE1 and PCDHA13 BINDING SITE2, designated SEQ ID:20910 and SEQ

ID:20917 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41435] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession NM_018904). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 3 (PCDHA3, Accession NM_018906) is another VGAM1151 host target gene. PCDHA3 BINDING SITE1 and PCDHA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA3 BINDING SITE1 and PCDHA3 BINDING SITE2, designated SEQ ID:20927 and SEQ ID:20930 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41436] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 3 (PCDHA3, Accession NM_018906). Accordingly, utilities of VGAM1151 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM_018907) is another VGAM1151 host target gene. PCDHA4 BINDING SITE1 and PCDHA4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA4 BINDING SITE1 and PCDHA4 BINDING SITE2, designated SEQ ID:20940 and SEQ ID:20947 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41437] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 4 (PCDHA4, Accession NM_018907). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA4. Protocadherin Alpha 6 (PCDHA6, Accession NM_018909) is another VGAM1151 host target gene. PCDHA6 BINDING SITE1 through PCDHA6 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA6 BINDING SITE1 through PCDHA6 BINDING SITE4, designated SEQ ID:20957, SEQ ID:20960, SEQ ID:25589 and SEQ ID:25592 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41438] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 6 (PCDHA6, Accession NM_018909). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 7 (PCDHA7, Accession NM_018910) is another VGAM1151 host target gene. PCDHA7 BINDING SITE1 and PCDHA7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA7 BINDING SITE1 and PCDHA7 BINDING SITE2, designated SEQ ID:20970 and SEQ ID:20977 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41439] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 7 (PCDHA7, Accession NM_018910). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA7. Protocadherin Alpha 9 (PCDHA9, Accession NM_031857) is another VGAM1151 host target gene. PCDHA9 BINDING SITE1 and PCDHA9 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA9, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE1 and PCDHA9 BINDING SITE2, designated SEQ ID:25603 and SEQ ID:25606 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41440] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898) is another VGAM1151 host target gene. PCDHAC1 BINDING SITE1 and PCDHAC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHAC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE1 and PCDHAC1 BINDING SITE2, designated SEQ ID:20849 and SEQ ID:20856 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41441] Another function of VGAM1151 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_006201) is another VGAM1151 host target gene. PCTK1 BINDING SITE1 through PCTK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

PCTK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK1 BINDING SITE1 through PCTK1 BINDING SITE3, designated SEQ ID:12872, SEQ ID:26907 and SEQ ID:26913 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41442] Another function of VGAM1151 is therefore inhibition of PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_006201), a gene which may play a role in signal transduction cascades in terminally differentiated cells. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCTK1. The function of PCTK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75. Palmitoyl-protein Thioesterase 2 (PPT2, Accession NM_138934) is another VGAM1151 host target gene. PPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPT2 BINDING SITE, designated SEQ ID:29061, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41443] Another function of VGAM1151 is therefore inhibition of Palmitoyl-protein Thioesterase 2 (PPT2, Accession NM_138934), a gene which is a palmitoyl-protein thioesterase 2 which possesses a different substrate specificity than PPT1. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT2. The function of PPT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Protein Tyrosine Kinase 2 Beta (PTK2B, Accession NM_004103) is another VGAM1151 host target gene. PTK2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTK2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK2B BINDING SITE, designated SEQ

ID:10313, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41444] Another function of VGAM1151 is therefore inhibition of Protein Tyrosine Kinase 2 Beta (PTK2B, Accession NM_004103), a gene which is involved in calcium induced regulation of ion channel and activation of the map kinase signaling pathway. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK2B. The function of PTK2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM555. Runt-related Transcription Factor 3 (RUNX3, Accession NM_004350) is another VGAM1151 host target gene. RUNX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX3 BINDING SITE, designated SEQ ID:10550, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ

ID:3862.

[41445] Another function of VGAM1151 is therefore inhibition of Runt-related Transcription Factor 3 (RUNX3, Accession NM_004350), a gene which binds to the core site, 5'-pygpyggt-3', of a number of enhancers and promoters. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX3. The function of RUNX3 has been established by previous studies. Levanon et al. (1994) isolated and characterized cDNAs corresponding to 3 human 'runt domain'-containing genes: AML1 (RUNX1; 151385), CBFA3, and CBFA1 (RUNX2; 600211). In addition to homology in the highly conserved runt domain, extensive sequence similarities were also observed in other parts of the deduced proteins. All 3 genes carried an identical putative ATP-binding site, -GRSGRGKS-, and their C-terminal halves were particularly rich in proline and serine residues. AML1 cDNAs had been cloned by others, whereas CBFA3 represented a new member of the runt domain gene family, and CBFA1 was identified as the human homolog of the mouse PEBP2A gene. Bae et al. (1995) also cloned and characterized RUNX3, which they termed PEBP2-alpha-C. By genomic sequence analysis,

Bae et al. (1995) determined that the RUNX3 gene contains at least 5 exons. By fluorescence in situ hybridization, Levanon et al. (1994) mapped the CBFA3 gene to 1p36. By FISH, Bae et al. (1995) mapped the RUNX3 gene to 1p36.13–p36.11. Avraham et al. (1995) mapped the homologous gene to mouse chromosome 4. By Southern blot analysis of hybrid cell lines containing different parts of human chromosome 1 and by fluorescence in situ hybridization, Wijmenga et al. (1995) assigned the CBFA3 gene to 1p35–pter. Li et al. (2002) showed that between 45 and 60% of human gastric cancer (OMIM Ref. No. 137215) cells do not significantly express RUNX3 due to hemizygous deletion and hypermethylation of the RUNX3 promoter region. Tumorigenicity of human gastric cancer cell lines in nude mice was inversely related to their level of RUNX3 expression. The authors identified a heterozygous C-to-T transition in the RUNX3 gene, resulting in an arg122-to-cys (R122C) change within the conserved Runt domain of the protein, in 1 gastric carcinoma tissue of 119 examined. Arginine at position 122 is conserved in both nematodes and humans. A tumorigenesis assay in nude mice showed that the R122C change abolished the tumor-suppressive effect of RUNX3, suggesting that a

lack of RUNX3 function is causally related to the genesis and progression of human gastric cancer. However, matching normal tissue was not available in this case and therefore it was not possible to establish whether the observed R122C change was a single-nucleotide polymorphism or a true mutation. Animal model experiments lend further support to the function of RUNX3. Li et al. (2002) generated mice with a targeted disruption of the Runx3 gene. The gastric mucosa of these mice exhibited hyperplasias due to stimulated proliferation and suppressed apoptosis in epithelial cells, and the cells were resistant to growth-inhibitory and apoptosis-inducing actions of transforming growth factor-beta (OMIM Ref. No. 190180), indicating that Runx3 is a major growth regulator of gastric epithelial cells. Inoue et al. (2002) generated Runx3-deficient mice and showed that proprioceptive afferent axons failed to project to their targets in the spinal cord as well as those in the muscle. In contrast, the afferent projections that convey nociception, thermoreception, and mechanoreception signals appeared normal. The mutant mice displayed severe limb ataxia and motor discoordination similar to that of Etv1 (OMIM Ref. No. 600541) mutant mice. Inoue et al. (2002) concluded that Runx3 is

critical in regulating a subpopulation of dorsal root ganglion neurons.

[41446] It is appreciated that the abovementioned animal model for RUNX3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[41447] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41448] Li, Q.-L.; Ito, K.; Sakakura, C.; Fukamachi, H.; Inoue, K.; Chi, X.-Z.; Lee, K.-Y.; Nomura, S.; Lee, C.-W.; Han, S.-B.; Kim, H.-M.; Kim, W.-J.; and 15 others : Causal relationship between the loss of RUNX3 expression and gastric cancer. Cell 109: 113-124, 2002. ; and

[41450] Further studies establishing the function and utilities of RUNX3 are found in John Hopkins OMIM database record ID 600210, and in cited publications numbered 1622-162 and 1630-1626 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence.SH3-domain Binding Protein 5 (BTK-associated) (SH3BP5, Accession NM_004844) is another VGAM1151 host target gene. SH3BP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP5 BINDING SITE, designated SEQ ID:11257, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41451] Another function of VGAM1151 is therefore inhibition of SH3-domain Binding Protein 5 (BTK-associated) (SH3BP5, Accession NM_004844), a gene which plays a negative regulatory role in btk-related cytoplasmic signaling in b cells. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP5. The function of SH3BP5 has been established by previous studies. Bruton tyrosine kinase (BTK; 300300) is a cytoplasmic tyrosine kinase crucial for the maturation of B-lineage cells. BTK deficiency is involved in the pathogenesis of X-linked immunodeficiency. By Far Western expression cloning using a human

placenta cDNA library for molecules associated with the SH3 domain of BTK, followed by screening brain and B-cell cDNA libraries, Matsushita et al. (1998) obtained a cDNA encoding SH3BP5, which they termed SAB (SH3 domain-binding protein that preferentially associates with BTK). SH3BP5 encodes a deduced 425-amino acid protein. Northern blot analysis revealed wide expression of a 3.0-kb transcript, with especially prominent expression in testis and ovary. Immunoblot analysis showed that SH3BP5 is expressed as a 70-kD protein. Immunoprecipitation analysis suggested that SH3BP5 interacts with BTK in cells. Mutational and immunoblot analyses showed that amino acids 163 to 193 of SH3BP5 bind most strongly to the SH3 domain of BTK and not with the SH3 domains of a number of other cytoplasmic tyrosine kinases. Using immunoprecipitation and functional analysis, Yamadori et al. (1999) demonstrated that SH3BP5 inhibits BTK activity by binding to the enzyme.

[41452] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41453] Matsushita, M.; Yamadori, T.; Kato, S.; Takemoto, Y.; Inazawa, J.; Baba, Y.; Hashimoto, S.; Sekine, S.; Arai, S.; Ku-

nikata, T.; Kurimoto, M.; Kishimoto, T.; Tsukada, S. : Identification and characterization of a novel SH3-domain binding protein, Sab, which preferentially associates with Bruton's tyrosine kinase (Btk). Biochem. Biophys. Res. Commun. 245: 337-343, 1998. ; and

[41454] Yamadori, T.; Baba, Y.; Matsushita, M.; Hashimoto, S.; Kurosaki, M.; Kurosaki, T.; Kishimoto, T.; Tsukada, S. : Bruton's tyrosine kinase activity is negatively regulated by Sab, the Btk-SH.

[41455] Further studies establishing the function and utilities of SH3BP5 are found in John Hopkins OMIM database record ID 605612, and in cited publications numbered 6772-677 and 6770 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. *Sine Oculis Homeobox Homolog 2 (Drosophila) (SIX2*, Accession NM_016932) is another VGAM1151 host target gene. SIX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIX2 BINDING SITE, designated SEQ ID:18850, to the nucleotide sequence of VGAM1151 RNA, herein

designated VGAM RNA, also designated SEQ ID:3862.

[41456] Another function of VGAM1151 is therefore inhibition of Sine Oculis Homeobox Homolog 2 (Drosophila) (SIX2, Accession NM_016932), a gene which may be involved in limb tendon and ligament development (by similarity). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIX2. The function of SIX2 has been established by previous studies. By screening a human genomic library with a human SIX1 cDNA (OMIM Ref. No. 601205), Boucher et al. (2000) identified the SIX2 gene. Using the SIX2 genomic sequence, they isolated a human fetus SIX2 cDNA. The predicted 291-amino acid SIX2 protein contains a SIX domain and a homeodomain. The human SIX2 protein is almost identical to the mouse Six2 protein. Northern blot analysis of human tissues detected strong expression of a major 2.2-kb SIX2 transcript in skeletal muscle, with weaker expression in pancreas. RT-PCR showed SIX2 expression in all human fetal tissues tested except lung. In adult tissues, RT-PCR revealed SIX2 expression in skeletal muscle, pancreas, ovary, and sclera; SIX2 expression was not detected in other regions of the adult eye and optic nerve or in adult heart, lung, kidney,

liver, or breast. Boucher et al. (2000) determined that the human SIX2 gene contains 2 exons.

[41457] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41458] Boucher, C. A.; Winchester, C. L.; Hamilton, G. M.; Winter, A. D.; Johnson, K. J.; Bailey, M. E. S. : Structure, mapping and expression of the human gene encoding the homeodomain protein, SIX2. Gene 247: 145–151, 2000. ; and

[41459] Oliver, G.; Wehr, R.; Jenkins, N. A.; Copeland, N. G.; Cheyette, B. N. R.; Hartenstein, V.; Zipursky, S. L.; Gruss, P. : Homeobox genes and connective tissue patterning. Development 12.

[41460] Further studies establishing the function and utilities of SIX2 are found in John Hopkins OMIM database record ID 604994, and in cited publications numbered 7101 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983) is another VGAM1151 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10129, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41461] Another function of VGAM1151 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87. Transducin (beta)-like 1X-linked (TBL1X, Accession NM_005647) is another VGAM1151 host target gene. TBL1X BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBL1X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1X BIND-

ING SITE, designated SEQ ID:12183, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41462] Another function of VGAM1151 is therefore inhibition of Transducin (beta)-like 1X-linked (TBL1X, Accession NM_005647), a gene which activates latent HDAC3 activity. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X. The function of TBL1X has been established by previous studies. In the course of constructing a deletion map of the distal portion of the short arm of the X chromosome and the identification of the OA1 gene (OMIM Ref. No. 300500), Bassi et al. (1999) performed cDNA selection experiments that resulted in the isolation of a novel gene, TBL1, located outside the OA1 critical region on the telomeric side. The TBL1 gene maps to the Xp22.3 region and shares significant homology with members of the WD40 repeat-containing protein family. The open reading frame encodes a 526-amino acid protein containing 6 beta-transducin repeats (WD40 motif) in the C-terminal domain. The homology with known beta-subunits of G proteins and other WD40 repeat-containing proteins is restricted to the WD40 motif.

Northern blot analysis indicated that the TBL1 gene is ubiquitously expressed as 2 transcripts of approximately 2.1 and 6.0 kb. Matsuzawa and Reed (2001) elucidated a network of protein interactions in which SIAH1 (OMIM Ref. No. 602212), SIP (OMIM Ref. No. 606186), SKP1 (OMIM Ref. No. 601434), and EBI collaborate in a pathway controlling beta-catenin (OMIM Ref. No. 116806) levels, affecting activity of beta-catenin-dependent TCF (e.g., TCF1; 142410) and LEF (e.g., LEF1; 153245) transcription factors. This pathway is inducible by p53 (OMIM Ref. No. 191170), revealing a link between genotoxic injury responses and beta-catenin degradation. SIAH1 is physically linked to EBI by association with SIP, which binds SKP1.

[41463] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41464] Bassi, M. T.; Ramesar, R. S.; Caciotti, B.; Winship, I. M.; De Grandi, A.; Riboni, M.; Townes, P. L.; Beighton, P.; Ballabio, A.; Borsani, G. : X-linked late-onset sensorineural deafness caused by a deletion involving OA1 and a novel gene containing WD-40 repeats. Am. J. Hum. Genet. 64: 1604-1616, 1999. ; and

[41465] Matsuzawa, S.; Reed, J. C. : Siah-1, SIP, and Ebi collaborate

in a novel pathway for beta-catenin degradation linked to p53 responses. *Molec. Cell* 7: 915–926, 2001.

[41466] Further studies establishing the function and utilities of TBL1X are found in John Hopkins OMIM database record ID 300196, and in cited publications numbered 11395–11398, 725 and 11399–11400 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242) is another VGAM1151 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB2 BINDING SITE, designated SEQ ID:9239, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41467] Another function of VGAM1151 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

TGFB2. Tumor Necrosis Factor (ligand) Superfamily, Member 5 (hyper-IgM syndrome) (TNFSF5, Accession NM_000074) is another VGAM1151 host target gene. TNFSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF5 BINDING SITE, designated SEQ ID:5519, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41468] Another function of VGAM1151 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 5 (hyper-IgM syndrome) (TNFSF5, Accession NM_000074). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF5. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM1151 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15352, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41469] Another function of VGAM1151 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM_031949) is another VGAM1151 host target gene. ACTR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR1A BINDING SITE, designated SEQ ID:31535, to the

nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41470] Another function of VGAM1151 is therefore inhibition of ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM_031949). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR1A. BCL2-like 1 (BCL2L1, Accession NM_138578) is another VGAM1151 host target gene. BCL2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L1 BINDING SITE, designated SEQ ID:28893, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41471] Another function of VGAM1151 is therefore inhibition of BCL2-like 1 (BCL2L1, Accession NM_138578). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L1. Baculoviral IAP Repeat-containing 5

(survivin) (BIRC5, Accession NM_001168) is another VGAM1151 host target gene. BIRC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC5 BINDING SITE, designated SEQ ID:6836, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41472] Another function of VGAM1151 is therefore inhibition of Baculoviral IAP Repeat-containing 5 (survivin) (BIRC5, Accession NM_001168). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC5. Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072) is another VGAM1151 host target gene. C1QR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, des-

ignated SEQ ID:14333, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41473] Another function of VGAM1151 is therefore inhibition of Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1. Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749) is another VGAM1151 host target gene. C20orf139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf139 BINDING SITE, designated SEQ ID:41105, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41474] Another function of VGAM1151 is therefore inhibition of Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with C20orf139. Chromosome 6 Open Reading Frame 9 (C6orf9, Accession NM_022107) is another VGAM1151 host target gene. C6orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf9 BINDING SITE, designated SEQ ID:22656, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41475] Another function of VGAM1151 is therefore inhibition of Chromosome 6 Open Reading Frame 9 (C6orf9, Accession NM_022107). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf9. CRK7 (Accession NM_016507) is another VGAM1151 host target gene. CRK7 BINDING SITE1 and CRK7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CRK7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of CRK7 BINDING SITE1 and CRK7 BINDING SITE2, designated SEQ ID:18586 and SEQ ID:18585 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41476] Another function of VGAM1151 is therefore inhibition of CRK7 (Accession NM_016507). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRK7. DCMF Deaminase (DCTD, Accession NM_001921) is another VGAM1151 host target gene. DCTD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCTD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCTD BINDING SITE, designated SEQ ID:7637, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41477] Another function of VGAM1151 is therefore inhibition of DCMF Deaminase (DCTD, Accession NM_001921). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with DCTD. FLJ12572 (Accession NM_022905) is another VGAM1151 host target gene. FLJ12572 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12572 BINDING SITE, designated SEQ ID:23202, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41478] Another function of VGAM1151 is therefore inhibition of FLJ12572 (Accession NM_022905). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12572. FLJ13154 (Accession NM_024598) is another VGAM1151 host target gene. FLJ13154 BINDING SITE1 through FLJ13154 BINDING SITE9 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ13154, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13154 BINDING SITE1 through FLJ13154 BINDING SITE9, designated SEQ ID:23837, SEQ

ID:23838, SEQ ID:23839, SEQ ID:23840, SEQ ID:23841, SEQ ID:23842, SEQ ID:23843, SEQ ID:23845 and SEQ ID:23846 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41479] Another function of VGAM1151 is therefore inhibition of FLJ13154 (Accession NM_024598). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13154. FLJ22671 (Accession NM_024861) is another VGAM1151 host target gene. FLJ22671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22671 BINDING SITE, designated SEQ ID:24295, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41480] Another function of VGAM1151 is therefore inhibition of FLJ22671 (Accession NM_024861). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22671. FLJ22679 (Accession NM_017698) is another VGAM1151 host target gene. FLJ22679 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22679 BINDING SITE, designated SEQ ID:19262, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41481] Another function of VGAM1151 is therefore inhibition of FLJ22679 (Accession NM_017698). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22679. FLJ23263 (Accession NM_025115) is another VGAM1151 host target gene. FLJ23263 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23263 BINDING SITE, designated SEQ ID:24766, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM

RNA, also designated SEQ ID:3862.

[41482] Another function of VGAM1151 is therefore inhibition of FLJ23263 (Accession NM_025115). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23263. FLJ30574 (Accession NM_144629) is another VGAM1151 host target gene. FLJ30574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30574 BINDING SITE, designated SEQ ID:29448, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41483] Another function of VGAM1151 is therefore inhibition of FLJ30574 (Accession NM_144629). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30574. HSPC065 (Accession NM_014157) is another VGAM1151 host target gene. HSPC065 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC065, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:15452, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41484] Another function of VGAM1151 is therefore inhibition of HSPC065 (Accession NM_014157). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. HIV TAT Specific Factor 1 (HTATSF1, Accession NM_014500) is another VGAM1151 host target gene. HTATSF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTATSF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTATSF1 BINDING SITE, designated SEQ ID:15837, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41485] Another function of VGAM1151 is therefore inhibition of HIV TAT Specific Factor 1 (HTATSF1, Accession

NM_014500). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTATSF1. JIK (Accession NM_016281) is another VGAM1151 host target gene. JIK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JIK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JIK BINDING SITE, designated SEQ ID:18408, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41486] Another function of VGAM1151 is therefore inhibition of JIK (Accession NM_016281). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JIK. KIAA0210 (Accession NM_014744) is another VGAM1151 host target gene. KIAA0210 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0210 BINDING SITE,

designated SEQ ID:16423, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41487] Another function of VGAM1151 is therefore inhibition of KIAA0210 (Accession NM_014744). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210. KIAA0450 (Accession NM_014638) is another VGAM1151 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16032, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41488] Another function of VGAM1151 is therefore inhibition of KIAA0450 (Accession NM_014638). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0721 (Accession NM_021648) is another VGAM1151 host target gene. KIAA0721 BINDING SITE1

and KIAA0721 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0721, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2, designated SEQ ID:22319 and SEQ ID:45926 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41489] Another function of VGAM1151 is therefore inhibition of KIAA0721 (Accession NM_021648). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0721. KIAA1029 (Accession NM_007286) is another VGAM1151 host target gene. KIAA1029 BINDING SITE1 and KIAA1029 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1029, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1029 BINDING SITE1 and KIAA1029 BINDING SITE2, designated SEQ ID:14145 and SEQ

ID:32639 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41490] Another function of VGAM1151 is therefore inhibition of KIAA1029 (Accession NM_007286). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1029. KIAA1384 (Accession XM_035405) is another VGAM1151 host target gene. KIAA1384 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1384 BINDING SITE, designated SEQ ID:32259, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41491] Another function of VGAM1151 is therefore inhibition of KIAA1384 (Accession XM_035405). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1384. MGC10765 (Accession NM_024345) is another VGAM1151 host target gene. MGC10765 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10765 BINDING SITE, designated SEQ ID:23644, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41492] Another function of VGAM1151 is therefore inhibition of MGC10765 (Accession NM_024345). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10765. MGC10812 (Accession NM_031425) is another VGAM1151 host target gene. MGC10812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10812 BINDING SITE, designated SEQ ID:25410, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41493] Another function of VGAM1151 is therefore inhibition of

MGC10812 (Accession NM_031425). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10812. MGC11115 (Accession NM_032310) is another VGAM1151 host target gene. MGC11115 BINDING SITE1 and MGC11115 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC11115, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE1 and MGC11115 BINDING SITE2, designated SEQ ID:26094 and SEQ ID:26095 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41494] Another function of VGAM1151 is therefore inhibition of MGC11115 (Accession NM_032310). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115. MGC13053 (Accession NM_032710) is another VGAM1151 host target gene. MGC13053 BINDING SITE1 and MGC13053 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by MGC13053, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13053 BINDING SITE1 and MGC13053 BINDING SITE2, designated SEQ ID:26424 and SEQ ID:27938 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41495] Another function of VGAM1151 is therefore inhibition of MGC13053 (Accession NM_032710). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13053. MGC4796 (Accession XM_029031) is another VGAM1151 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30835, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41496] Another function of VGAM1151 is therefore inhibition of

MGC4796 (Accession XM_029031). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796. MOST2 (Accession NM_020250) is another VGAM1151 host target gene. MOST2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:21552, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41497] Another function of VGAM1151 is therefore inhibition of MOST2 (Accession NM_020250). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. NPD009 (Accession XM_170795) is another VGAM1151 host target gene. NPD009 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NPD009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of NPD009 BINDING SITE, designated SEQ ID:45564, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41498] Another function of VGAM1151 is therefore inhibition of NPD009 (Accession XM_170795). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPD009. Neuritin 1 (NRN1, Accession NM_016588) is another VGAM1151 host target gene. NRN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRN1 BINDING SITE, designated SEQ ID:18664, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41499] Another function of VGAM1151 is therefore inhibition of Neuritin 1 (NRN1, Accession NM_016588). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRN1. Olfactory Receptor, Family 7, Subfamily C,

Member 1 (OR7C1, Accession NM_017506) is another VGAM1151 host target gene. OR7C1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OR7C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR7C1 BINDING SITE, designated SEQ ID:18962, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41500] Another function of VGAM1151 is therefore inhibition of Olfactory Receptor, Family 7, Subfamily C, Member 1 (OR7C1, Accession NM_017506). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR7C1. PFTK1 Protein Kinase 1 (PFTK1, Accession NM_012395) is another VGAM1151 host target gene. PFTK1 BINDING SITE1 and PFTK1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PFTK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFTK1 BINDING SITE1 and PFTK1 BINDING

SITE2, designated SEQ ID:14752 and SEQ ID:14753 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41501] Another function of VGAM1151 is therefore inhibition of PFTAIK Protein Kinase 1 (PFTK1, Accession NM_012395). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFTK1. Regulatory Factor X, 3 (influences HLA class II expression) (RFX3, Accession NM_134428) is another VGAM1151 host target gene. RFX3 BINDING SITE1 and RFX3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RFX3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX3 BINDING SITE1 and RFX3 BINDING SITE2, designated SEQ ID:28670 and SEQ ID:8828 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41502] Another function of VGAM1151 is therefore inhibition of Regulatory Factor X, 3 (influences HLA class II expression)

(RFX3, Accession NM_134428). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX3. Tripartite Motif-containing 15 (TRIM15, Accession NM_033229) is another VGAM1151 host target gene. TRIM15 BINDING SITE1 and TRIM15 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRIM15, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM15 BINDING SITE1 and TRIM15 BINDING SITE2, designated SEQ ID:27074 and SEQ ID:27075 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41503] Another function of VGAM1151 is therefore inhibition of Tripartite Motif-containing 15 (TRIM15, Accession NM_033229). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM15. LOC112868 (Accession XM_053402) is another VGAM1151 host target gene. LOC112868 BINDING SITE1 through LOC112868 BINDING SITE4 are HOST TARGET binding sites found in

untranslated regions of mRNA encoded by LOC112868, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE1 through LOC112868 BINDING SITE4, designated SEQ ID:36080, SEQ ID:36081, SEQ ID:36086 and SEQ ID:36087 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41504] Another function of VGAM1151 is therefore inhibition of LOC112868 (Accession XM_053402). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC113612 (Accession XM_054492) is another VGAM1151 host target gene. LOC113612 BINDING SITE1 and LOC113612 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC113612, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113612 BINDING SITE1 and LOC113612 BINDING SITE2, designated SEQ ID:36170

and SEQ ID:36570 respectively, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41505] Another function of VGAM1151 is therefore inhibition of LOC113612 (Accession XM_054492). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113612. LOC131034 (Accession NM_130808) is another VGAM1151 host target gene. LOC131034 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC131034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131034 BINDING SITE, designated SEQ ID:28316, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41506] Another function of VGAM1151 is therefore inhibition of LOC131034 (Accession NM_130808). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131034. LOC144231 (Accession XM_096561) is another VGAM1151 host target gene. LOC144231 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144231 BINDING SITE, designated SEQ ID:40392, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41507] Another function of VGAM1151 is therefore inhibition of LOC144231 (Accession XM_096561). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144231. LOC144262 (Accession XM_084793) is another VGAM1151 host target gene. LOC144262 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144262 BINDING SITE, designated SEQ ID:37704, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41508] Another function of VGAM1151 is therefore inhibition of

LOC144262 (Accession XM_084793). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144262. LOC146839 (Accession XM_097107) is another VGAM1151 host target gene. LOC146839 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146839 BINDING SITE, designated SEQ ID:40754, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41509] Another function of VGAM1151 is therefore inhibition of LOC146839 (Accession XM_097107). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146839. LOC150577 (Accession XM_097918) is another VGAM1151 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41221, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41510] Another function of VGAM1151 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC151742 (Accession NM_139245) is another VGAM1151 host target gene. LOC151742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151742 BINDING SITE, designated SEQ ID:29243, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41511] Another function of VGAM1151 is therefore inhibition of LOC151742 (Accession NM_139245). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151742. LOC154761 (Accession XM_088038) is an-

other VGAM1151 host target gene. LOC154761 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154761 BINDING SITE, designated SEQ ID:39484, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41512] Another function of VGAM1151 is therefore inhibition of LOC154761 (Accession XM_088038). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154761. LOC201617 (Accession XM_117315) is another VGAM1151 host target gene. LOC201617 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201617 BINDING SITE, designated SEQ ID:43381, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41513] Another function of VGAM1151 is therefore inhibition of LOC201617 (Accession XM_117315). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201617. LOC201799 (Accession XM_114380) is another VGAM1151 host target gene. LOC201799 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201799 BINDING SITE, designated SEQ ID:42917, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41514] Another function of VGAM1151 is therefore inhibition of LOC201799 (Accession XM_114380). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201799. LOC221477 (Accession XM_166397) is another VGAM1151 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44261, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41515] Another function of VGAM1151 is therefore inhibition of LOC221477 (Accession XM_166397). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC221662 (Accession XM_166466) is another VGAM1151 host target gene. LOC221662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221662 BINDING SITE, designated SEQ ID:44388, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41516] Another function of VGAM1151 is therefore inhibition of LOC221662 (Accession XM_166466). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221662. LOC253847 (Accession XM_171145) is another VGAM1151 host target gene. LOC253847 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253847, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253847 BINDING SITE, designated SEQ ID:45940, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41517] Another function of VGAM1151 is therefore inhibition of LOC253847 (Accession XM_171145). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253847. LOC254945 (Accession XM_173038) is another VGAM1151 host target gene. LOC254945 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254945 BINDING SITE, designated SEQ ID:46305, to the nucleotide sequence of VGAM1151 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3862.

[41518] Another function of VGAM1151 is therefore inhibition of LOC254945 (Accession XM_173038). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254945. LOC51008 (Accession NM_015947) is another VGAM1151 host target gene. LOC51008 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51008 BINDING SITE, designated SEQ ID:18063, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41519] Another function of VGAM1151 is therefore inhibition of LOC51008 (Accession NM_015947). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51008. LOC56930 (Accession XM_030603) is another VGAM1151 host target gene. LOC56930 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56930, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56930 BINDING SITE, designated SEQ ID:31092, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41520] Another function of VGAM1151 is therefore inhibition of LOC56930 (Accession XM_030603). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56930. LOC91812 (Accession XM_040857) is another VGAM1151 host target gene. LOC91812 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91812 BINDING SITE, designated SEQ ID:33392, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41521] Another function of VGAM1151 is therefore inhibition of LOC91812 (Accession XM_040857). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91812. LOC91813 (Accession XM_040862) is another VGAM1151 host target gene. LOC91813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91813 BINDING SITE, designated SEQ ID:33400, to the nucleotide sequence of VGAM1151 RNA, herein designated VGAM RNA, also designated SEQ ID:3862.

[41522] Another function of VGAM1151 is therefore inhibition of LOC91813 (Accession XM_040862). Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1152 (VGAM1152) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41523] VGAM1152 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1152 was detected is described hereinabove with reference to Figs. 1–8.

[41524] VGAM1152 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM1152 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41525] VGAM1152 gene encodes a VGAM1152 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1152 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1152 precursor RNA is designated SEQ ID:1138, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1138 is located at position 4584 relative to the genome of Cowpox Virus.

[41526] VGAM1152 precursor RNA folds onto itself, forming VGAM1152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41527] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1152 folded precursor RNA into VGAM1152 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1152 RNA is designated SEQ ID:3863, and is provided hereinbelow with reference to the sequence listing part.

[41528] VGAM1152 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1152 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41529] VGAM1152 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1152 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1152 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41530] The complementary binding of VGAM1152 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1152 host target RNA into VGAM1152 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41531] It is appreciated that VGAM1152 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1152 host target genes. The mRNA of each one of this plurality of VGAM1152 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1152 RNA, herein designated VGAM RNA, and which when bound by VGAM1152 RNA causes inhibition of translation of respective one or more VGAM1152 host target proteins.

[41532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1152 gene, herein designated VGAM GENE, on one or more VGAM1152 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41533] It is yet further appreciated that a function of VGAM1152 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1152 correlate with, and may be deduced from, the identity of the host target genes which VGAM1152 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41534] Nucleotide sequences of the VGAM1152 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1152 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1152 are further described hereinbelow with reference to Table 1.

[41535] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1152 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1152 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41536] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1152 gene, herein designated VGAM is inhibition of expression of VGAM1152 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1152 correlate with, and may be deduced from, the identity of the target genes which VGAM1152 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41537] EphA3 (EPHA3, Accession NM_005233) is a VGAM1152 host target gene. EPHA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by EPHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA3 BINDING SITE, designated SEQ ID:11743, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41538] A function of VGAM1152 is therefore inhibition of EphA3 (EPHA3, Accession NM_005233), a gene which binds to ephrin-a2, -a3, -a4 and -a5. could play a role in lymphoid function. Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA3. The function of EPHA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM164. Gamma-aminobutyric Acid (GABA) A Receptor, Pi (GABRP, Accession NM_014211) is another VGAM1152 host target gene. GABRP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GABRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of GABRP BINDING SITE, designated SEQ ID:15479, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41539] Another function of VGAM1152 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, ρ 1 (GABRP, Accession NM_014211), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRP. The function of GABRP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795. Tuftelin 1 (TUFT1, Accession NM_020127) is another VGAM1152 host target gene. TUFT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUFT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUFT1 BINDING SITE, designated SEQ ID:21318, to the nucleotide sequence of VGAM1152 RNA,

herein designated VGAM RNA, also designated SEQ ID:3863.

[41540] Another function of VGAM1152 is therefore inhibition of Tuftelin 1 (TUFT1, Accession NM_020127), a gene which appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping. Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUFT1. The function of TUFT1 has been established by previous studies. Tuftelin is an acidic protein found in developing and mature extracellular enamel, the unique and highly mineralized ectodermal tissue covering vertebrate teeth (Deutsch, 1989; Deutsch et al., 1991). It is thought to play a major role in mineralization and structural organization of enamel. By fluorescence in situ hybridization, Deutsch et al. (1994) mapped the TUFT1 gene to 1q21-q31. They raised the possibility that an autosomal dominant form of amelogenesis imperfecta (104500, 104530) is due to a mutation in this gene. By FISH, Bashir et al. (1998) localized the TUFT1 gene to 1q21.

[41541] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [41542] Deutsch, D.; Palmon, A.; Fisher, L. W.; Kolodny, N.; Termine, J. D.; Young, M. F. : Sequencing of bovine enamelin (tuftelin), a novel acidic enamel protein. J. Biol. Chem. 266: 16021–16028, 1991. ; and
- [41543] Deutsch, D.; Palmon, A.; Young, M. F.; Selig, S.; Kearns, W. G.; Fisher, L. W. : Mapping of the human tuftelin (TUFT1) gene to chromosome 1 by fluorescence in situ hybridization. (Abstrac.
- [41544] Further studies establishing the function and utilities of TUFT1 are found in John Hopkins OMIM database record ID 600087, and in cited publications numbered 7900–7901, 821 and 8224–8226 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ABLIM (Accession NM_006720) is another VGAM1152 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:13550 and SEQ ID:8117 respec–

tively, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41545] Another function of VGAM1152 is therefore inhibition of ABLIM (Accession NM_006720). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. KIAA0565 (Accession XM_039912) is another VGAM1152 host target gene. KIAA0565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0565 BINDING SITE, designated SEQ ID:33220, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41546] Another function of VGAM1152 is therefore inhibition of KIAA0565 (Accession XM_039912). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565. KIAA0635 (Accession NM_014645) is another VGAM1152 host target gene. KIAA0635 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0635 BINDING SITE, designated SEQ ID:16054, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41547] Another function of VGAM1152 is therefore inhibition of KIAA0635 (Accession NM_014645). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0635. MacGAP (Accession NM_033515) is another VGAM1152 host target gene. MacGAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MacGAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MacGAP BINDING SITE, designated SEQ ID:27289, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41548] Another function of VGAM1152 is therefore inhibition of

MacGAP (Accession NM_033515). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MacGAP. MGC13130 (Accession NM_032890) is another VGAM1152 host target gene. MGC13130 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13130 BINDING SITE, designated SEQ ID:26713, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41549] Another function of VGAM1152 is therefore inhibition of MGC13130 (Accession NM_032890). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13130. LOC131368 (Accession XM_067347) is another VGAM1152 host target gene. LOC131368 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC131368 BINDING SITE, designated SEQ ID:37355, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41550] Another function of VGAM1152 is therefore inhibition of LOC131368 (Accession XM_067347). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131368. LOC153077 (Accession XM_098307) is another VGAM1152 host target gene. LOC153077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:41569, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41551] Another function of VGAM1152 is therefore inhibition of LOC153077 (Accession XM_098307). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077. LOC256207 (Accession XM_170837) is an-

other VGAM1152 host target gene. LOC256207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256207 BINDING SITE, designated SEQ ID:45621, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41552] Another function of VGAM1152 is therefore inhibition of LOC256207 (Accession XM_170837). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256207. LOC90288 (Accession XM_030669) is another VGAM1152 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31112, to the nucleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, also designated SEQ ID:3863.

[41553] Another function of VGAM1152 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1153 (VGAM1153) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41554] VGAM1153 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1153 was detected is described hereinabove with reference to Figs. 1–8.

[41555] VGAM1153 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM1153 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41556] VGAM1153 gene encodes a VGAM1153 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1153 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1153 precursor RNA is designated SEQ ID:1139, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1139 is located at position 2676 relative to the genome of Cowpox Virus.

[41557] VGAM1153 precursor RNA folds onto itself, forming VGAM1153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41558] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1153 folded precursor RNA into VGAM1153 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1153 RNA is designated SEQ ID:3864, and is provided hereinbelow with reference to the sequence listing part.

[41559] VGAM1153 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1153 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[41560] VGAM1153 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1153 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1153 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41561] The complementary binding of VGAM1153 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1153 host target RNA into VGAM1153 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41562] It is appreciated that VGAM1153 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1153 host target genes. The mRNA of each one of this plurality of VGAM1153 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1153 RNA, herein designated VGAM RNA, and which when bound by VGAM1153 RNA causes inhibition of translation of respective one or more VGAM1153 host target proteins.

[41563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1153 gene, herein designated VGAM GENE, on one or more VGAM1153 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41564] It is yet further appreciated that a function of VGAM1153 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1153 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1153 correlate with, and may be deduced from, the identity of the host target genes which VGAM1153 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41565] Nucleotide sequences of the VGAM1153 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1153 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1153 are further described hereinbelow with reference to Table 1.

[41566] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1153 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1153 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[41567] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1153 gene, herein designated VGAM is inhibition of expression of VGAM1153 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1153 correlate with, and may be deduced from, the identity of the target genes which VGAM1153 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41568] Ac-like Transposable Element (ALTE, Accession NM_004729) is a VGAM1153 host target gene. ALTE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALTE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALTE BINDING SITE, designated SEQ ID:11107, to the nucleotide sequence of VGAM1153 RNA, herein designated VGAM RNA, also designated SEQ ID:3864.

[41569] A function of VGAM1153 is therefore inhibition of Ac-like Transposable Element (ALTE, Accession NM_004729). Accordingly, utilities of VGAM1153 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with ALTE. FLJ23598 (Accession NM_024783) is another VGAM1153 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:24158, to the nucleotide sequence of VGAM1153 RNA, herein designated VGAM RNA, also designated SEQ ID:3864.

[41570] Another function of VGAM1153 is therefore inhibition of FLJ23598 (Accession NM_024783). Accordingly, utilities of VGAM1153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. HMP19 (Accession XM_113455) is another VGAM1153 host target gene. HMP19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMP19 BINDING SITE, designated SEQ ID:42273, to the nucleotide sequence of VGAM1153 RNA, herein designated VGAM RNA,

also designated SEQ ID:3864.

[41571] Another function of VGAM1153 is therefore inhibition of HMP19 (Accession XM_113455). Accordingly, utilities of VGAM1153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMP19. KIAA1710 (Accession XM_031283) is another VGAM1153 host target gene. KIAA1710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1710 BINDING SITE, designated SEQ ID:31332, to the nucleotide sequence of VGAM1153 RNA, herein designated VGAM RNA, also designated SEQ ID:3864.

[41572] Another function of VGAM1153 is therefore inhibition of KIAA1710 (Accession XM_031283). Accordingly, utilities of VGAM1153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1710. LOC143943 (Accession XM_096504) is another VGAM1153 host target gene. LOC143943 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143943, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143943 BINDING SITE, designated SEQ ID:40384, to the nucleotide sequence of VGAM1153 RNA, herein designated VGAM RNA, also designated SEQ ID:3864.

[41573] Another function of VGAM1153 is therefore inhibition of LOC143943 (Accession XM_096504). Accordingly, utilities of VGAM1153 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143943. LOC58489 (Accession XM_051862) is another VGAM1153 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35905, to the nucleotide sequence of VGAM1153 RNA, herein designated VGAM RNA, also designated SEQ ID:3864.

[41574] Another function of VGAM1153 is therefore inhibition of LOC58489 (Accession XM_051862). Accordingly, utilities of VGAM1153 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC58489. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1154 (VGAM1154) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41575] VGAM1154 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1154 was detected is described hereinabove with reference to Figs. 1–8.

[41576] VGAM1154 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1154 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41577] VGAM1154 gene encodes a VGAM1154 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1154 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1154 precursor RNA is desig-

nated SEQ ID:1140, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1140 is located at position 1704 relative to the genome of Cowpox Virus.

- [41578] VGAM1154 precursor RNA folds onto itself, forming VGAM1154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [41579] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1154 folded precursor RNA into VGAM1154 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1154 RNA is designated SEQ ID:3865, and is provided hereinbelow with reference to the sequence

listing part.

[41580] VGAM1154 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1154 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41581] VGAM1154 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1154 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1154 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41582] The complementary binding of VGAM1154 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1154 host target RNA into VGAM1154 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41583] It is appreciated that VGAM1154 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1154 host target genes. The mRNA of each one of this plurality of VGAM1154 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1154 RNA, herein designated VGAM

RNA, and which when bound by VGAM1154 RNA causes inhibition of translation of respective one or more VGAM1154 host target proteins.

[41584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1154 gene, herein designated VGAM GENE, on one or more VGAM1154 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41585] It is yet further appreciated that a function of VGAM1154 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1154 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1154 correlate with, and may be deduced from, the identity of the host target genes which VGAM1154 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41586] Nucleotide sequences of the VGAM1154 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1154 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1154 are further described hereinbelow with reference to Table 1.

[41587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1154 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1154 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41588] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1154 gene, herein designated VGAM is

inhibition of expression of VGAM1154 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1154 correlate with, and may be deduced from, the identity of the target genes which VGAM1154 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41589] Cyclic Nucleotide Gated Channel Beta 3 (CNGB3, Accession NM_019098) is a VGAM1154 host target gene. CNGB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNGB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNGB3 BINDING SITE, designated SEQ ID:21175, to the nucleotide sequence of VGAM1154 RNA, herein designated VGAM RNA, also designated SEQ ID:3865.

[41590] A function of VGAM1154 is therefore inhibition of Cyclic Nucleotide Gated Channel Beta 3 (CNGB3, Accession NM_019098). Accordingly, utilities of VGAM1154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNGB3. Calneuron 1 (CALN1, Accession NM_031468) is another VGAM1154 host target gene. CALN1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25517, to the nucleotide sequence of VGAM1154 RNA, herein designated VGAM RNA, also designated SEQ ID:3865.

[41591] Another function of VGAM1154 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM1154 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1155 (VGAM1155) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41592] VGAM1155 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1155 was detected is described hereinabove with reference to Figs. 1-8.

[41593] VGAM1155 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM1155 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41594] VGAM1155 gene encodes a VGAM1155 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1155 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1155 precursor RNA is designated SEQ ID:1141, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1141 is located at position 147349 relative to the genome of Cowpox Virus.

[41595] VGAM1155 precursor RNA folds onto itself, forming VGAM1155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[41596] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1155 folded precursor RNA into VGAM1155 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1155 RNA is designated SEQ ID:3866, and is provided hereinbelow with reference to the sequence listing part.

[41597] VGAM1155 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1155 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1155 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41598] VGAM1155 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1155 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1155 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1155 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1155 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41599] The complementary binding of VGAM1155 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1155 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1155 host target RNA into VGAM1155 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41600] It is appreciated that VGAM1155 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1155 host target genes. The mRNA of each one of this plurality of VGAM1155 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1155 RNA, herein designated VGAM RNA, and which when bound by VGAM1155 RNA causes inhibition of translation of respective one or more VGAM1155 host target proteins.

[41601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1155 gene, herein designated VGAM GENE, on one or more VGAM1155 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41602] It is yet further appreciated that a function of VGAM1155 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1155 correlate with, and may be deduced from, the identity of the host target genes which VGAM1155 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41603] Nucleotide sequences of the VGAM1155 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1155 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1155 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1155 are further described hereinbelow with reference to Table 1.

[41604] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1155 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1155 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41605] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1155 gene, herein designated VGAM is inhibition of expression of VGAM1155 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1155 correlate with, and may be deduced from, the identity of the target genes which VGAM1155 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41606] Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858) is a VGAM1155 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:7594, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41607] A function of VGAM1155 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM19.ErbB2 Interacting Protein (ERBB2IP, Accession NM_018695) is another VGAM1155 host target gene. ERBB2IP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ERBB2IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB2IP BINDING SITE, designated SEQ ID:20774, to the nucleotide

sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41608] Another function of VGAM1155 is therefore inhibition of Erbb2 Interacting Protein (ERBB2IP, Accession NM_018695), a gene which ERBB2 interacting protein; acts as an adaptor for the receptor ERBB2/HER2. Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB2IP. The function of ERBB2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1019. Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM_002410) is another VGAM1155 host target gene. MGAT5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT5 BINDING SITE, designated SEQ ID:8239, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ

ID:3866.

[41609] Another function of VGAM1155 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM_002410). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT5. Retinoid X Receptor, Beta (RXRB, Accession NM_021976) is another VGAM1155 host target gene. RXRB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RXRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RXRB BINDING SITE, designated SEQ ID:22501, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41610] Another function of VGAM1155 is therefore inhibition of Retinoid X Receptor, Beta (RXRB, Accession NM_021976), a gene which binds to and serves as transcriptional coactivator for retinoic acid. Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RXRB. The function

of RXRB has been established by previous studies. The retinoic acid receptors, alpha (RARA; 180240), beta (RARB; 180220), and gamma (RARG; 180190), require coregulators to bind effectively to response elements and target genes. By a strategy of sequential screening of expression libraries with a retinoic acid response element and RAR, Yu et al. (1991) identified a cDNA encoding a coregulator highly related to RXR-alpha (OMIM Ref. No. 180245). This protein, termed RXR-beta, formed heterodimers with RAR, preferentially increasing its DNA binding and transcriptional activity on promoters containing retinoic acid, but not thyroid hormone or vitamin D, response elements. Remarkably, RXR-beta also heterodimerized with thyroid hormone and vitamin D receptors, increasing both DNA binding and transcriptional function on their respective response elements. RXR-alpha also formed heterodimers with these receptors. These observations suggested that retinoid X receptors meet the criteria for biochemically characterized cellular coregulators and serve to target selectively the high affinity binding of retinoic acid, thyroid hormone, and vitamin D receptors to their cognate DNA response elements. In an elegant series of experiments designed to understand the effect of RXR activation on

cholesterol balance, Repa et al. (2000) treated animals with the rexinoid LG268. Animals treated with rexinoid exhibited marked changes in cholesterol balance, including inhibition of cholesterol absorption and repressed bile acid synthesis. Studies with receptor-selective agonists revealed that oxysterol receptors (LXRs, OMIM Ref. No. 602423 and 600380) and the bile acid receptor, FXR (OMIM Ref. No. 603826), are the RXR heterodimeric partners that mediate these effects by regulating expression of the reverse-cholesterol transporter, ABC1 (OMIM Ref. No. 600046), and the rate-limiting enzyme of bile acid synthesis, CYP7A1 (OMIM Ref. No. 118455), respectively. These RXR heterodimers serve as key regulators in cholesterol homeostasis by governing reverse cholesterol transport from peripheral tissues, bile acid synthesis in liver, and cholesterol absorption in intestine. Activation of RXR/LXR heterodimers inhibits cholesterol absorption by upregulation of ABC1 expression in the small intestine. Activation of RXR/FXR heterodimers represses CYP7A1 expression and bile acid production, leading to a failure to solubilize and absorb cholesterol. Studies have shown that RXR/FXR-mediated repression of CYP7A1 is dominant over RXR/LXR-mediated induction of CYP7A1, which ex-

plains why the rexinoid represses rather than activates CYP7A1 (Lu et al., 2000). Activation of the LXR signaling pathway results in the upregulation of ABC1 in peripheral cells, including macrophages, to efflux free cholesterol for transport back to the liver through high density lipoprotein, where it is converted to bile acids by the LXR-mediated increase in CYP7A1 expression. Secretion of biliary cholesterol in the presence of increased bile acid pools normally results in enhanced reabsorption of cholesterol; however, with the increased expression of ABC1 and efflux of cholesterol back into the lumen, there is a reduction in cholesterol absorption and net excretion of cholesterol and bile acid. Rexinoids therefore offer a novel class of agents for treating elevated cholesterol

[41614] Further studies establishing the function and utilities of RXRB are found in John Hopkins OMIM database record ID 180246, and in cited publications numbered 2726, 5949–5950, 5938, 5941, 595 and 5952 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ23598 (Accession NM_024783) is another VGAM1155 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:24153, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41615] Another function of VGAM1155 is therefore inhibition of FLJ23598 (Accession NM_024783). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. KIAA1128 (Accession XM_043596) is another VGAM1155 host target gene. KIAA1128 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33965, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41616] Another function of VGAM1155 is therefore inhibition of KIAA1128 (Accession XM_043596). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128. Kelch-like 6 (*Drosophila*) (KLHL6, Accession NM_130446) is another VGAM1155 host target gene. KLHL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ ID:28209, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41617] Another function of VGAM1155 is therefore inhibition of Kelch-like 6 (*Drosophila*) (KLHL6, Accession NM_130446). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6. MGC10966 (Accession NM_031471) is another VGAM1155 host target gene. MGC10966 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10966 BINDING SITE, designated SEQ ID:25535, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41618] Another function of VGAM1155 is therefore inhibition of MGC10966 (Accession NM_031471). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10966. MGC15873 (Accession NM_032920) is another VGAM1155 host target gene. MGC15873 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15873, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15873 BINDING SITE, designated SEQ ID:26742, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41619] Another function of VGAM1155 is therefore inhibition of MGC15873 (Accession NM_032920). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15873. Platelet Derived Growth Factor C (PDGFC, Accession NM_016205) is another VGAM1155 host target gene. PDGFC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFC BINDING SITE, designated SEQ ID:18301, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41620] Another function of VGAM1155 is therefore inhibition of Platelet Derived Growth Factor C (PDGFC, Accession

NM_016205). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFC. POPX1 (Accession NM_014906) is another VGAM1155 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17121, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41621] Another function of VGAM1155 is therefore inhibition of POPX1 (Accession NM_014906). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704) is another VGAM1155 host target gene. SAMHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SAMHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SAMHD1 BINDING SITE, designated SEQ ID:30733, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41622] Another function of VGAM1155 is therefore inhibition of SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAMHD1. SCYD1 (Accession XM_165650) is another VGAM1155 host target gene. SCYD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYD1 BINDING SITE, designated SEQ ID:43711, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41623] Another function of VGAM1155 is therefore inhibition of SCYD1 (Accession XM_165650). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SCYD1. Sialyltransferase 9 (CMP-NeuAc:lactosylceramide alpha-2,3-sialyltransferase; GM3 synthase) (SIAT9, Accession NM_003896) is another VGAM1155 host target gene. SIAT9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIAT9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT9 BINDING SITE, designated SEQ ID:9976, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41624] Another function of VGAM1155 is therefore inhibition of Sialyltransferase 9 (CMP-NeuAc:lactosylceramide alpha-2,3-sialyltransferase; GM3 synthase) (SIAT9, Accession NM_003896). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT9. LOC127534 (Accession XM_060532) is another VGAM1155 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37171, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41625] Another function of VGAM1155 is therefore inhibition of LOC127534 (Accession XM_060532). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC130535 (Accession XM_072244) is another VGAM1155 host target gene. LOC130535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130535 BINDING SITE, designated SEQ ID:37475, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41626] Another function of VGAM1155 is therefore inhibition of LOC130535 (Accession XM_072244). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC130535. LOC221395 (Accession XM_166354) is another VGAM1155 host target gene. LOC221395 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221395 BINDING SITE, designated SEQ ID:44185, to the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, also designated SEQ ID:3866.

[41627] Another function of VGAM1155 is therefore inhibition of LOC221395 (Accession XM_166354). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221395. LOC91947 (Accession XM_041721) is another VGAM1155 host target gene. LOC91947 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91947, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91947 BINDING SITE, designated SEQ ID:33569, to the nucleotide sequence of VGAM1155 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3866.

[41628] Another function of VGAM1155 is therefore inhibition of LOC91947 (Accession XM_041721). Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91947. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1156 (VGAM1156) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41629] VGAM1156 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1156 was detected is described hereinabove with reference to Figs. 1–8.

[41630] VGAM1156 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1156 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41631] VGAM1156 gene encodes a VGAM1156 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1156 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1156 precursor RNA is designated SEQ ID:1142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1142 is located at position 134779 relative to the genome of Camelpox Virus.

[41632] VGAM1156 precursor RNA folds onto itself, forming VGAM1156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41633] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1156 folded precursor RNA into VGAM1156 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1156 RNA is designated SEQ ID:3867, and is provided hereinbelow with reference to the sequence listing part.

[41634] VGAM1156 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1156 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41635] VGAM1156 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1156 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1156 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41636] The complementary binding of VGAM1156 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1156 host target RNA into VGAM1156 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41637] It is appreciated that VGAM1156 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1156 host target genes. The mRNA of

each one of this plurality of VGAM1156 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1156 RNA, herein designated VGAM RNA, and which when bound by VGAM1156 RNA causes inhibition of translation of respective one or more VGAM1156 host target proteins.

[41638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1156 gene, herein designated VGAM GENE, on one or more VGAM1156 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[41639] It is yet further appreciated that a function of VGAM1156 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1156 correlate with, and may be deduced from, the identity of the host target genes which VGAM1156 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41640] Nucleotide sequences of the VGAM1156 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1156 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1156 are further described hereinbelow with reference to Table 1.

[41641] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1156 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1156 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41642] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1156 gene, herein designated VGAM is inhibition of expression of VGAM1156 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1156 correlate with, and may be deduced from, the identity of the target genes which VGAM1156 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41643] BDG-29 (Accession XM_051343) is a VGAM1156 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35816, to the nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, also designated SEQ ID:3867.

[41644] A function of VGAM1156 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with BDG-29. Chromosome 21 Open Reading Frame 6 (C21orf6, Accession NM_016940) is another VGAM1156 host target gene. C21orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf6 BINDING SITE, designated SEQ ID:18855, to the nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, also designated SEQ ID:3867.

[41645] Another function of VGAM1156 is therefore inhibition of Chromosome 21 Open Reading Frame 6 (C21orf6, Accession NM_016940). Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf6. DKFZp434D177 (Accession NM_032264) is another VGAM1156 host target gene. DKFZp434D177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434D177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZp434D177 BINDING SITE, designated SEQ ID:26007, to the nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, also designated SEQ ID:3867.

[41646] Another function of VGAM1156 is therefore inhibition of DKFZp434D177 (Accession NM_032264). Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434D177. HSA249128 (Accession NM_017583) is another VGAM1156 host target gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19027, to the nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, also designated SEQ ID:3867.

[41647] Another function of VGAM1156 is therefore inhibition of HSA249128 (Accession NM_017583). Accordingly, utilities of VGAM1156 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with HSA249128. KIAA1634 (Accession XM_032749) is another VGAM1156 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31751, to the nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, also designated SEQ ID:3867.

[41648] Another function of VGAM1156 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. KIAA1941 (Accession XM_059318) is another VGAM1156 host target gene. KIAA1941 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1941 BINDING SITE, designated SEQ ID:36951, to the

nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, also designated SEQ ID:3867.

[41649] Another function of VGAM1156 is therefore inhibition of KIAA1941 (Accession XM_059318). Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1941. PRO2533 (Accession NM_018629) is another VGAM1156 host target gene. PRO2533 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2533 BINDING SITE, designated SEQ ID:20702, to the nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, also designated SEQ ID:3867.

[41650] Another function of VGAM1156 is therefore inhibition of PRO2533 (Accession NM_018629). Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2533. LOC151201 (Accession XM_098021) is another VGAM1156 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41323, to the nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, also designated SEQ ID:3867.

[41651] Another function of VGAM1156 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1157 (VGAM1157) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41652] VGAM1157 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1157 was detected is described hereinabove with reference to Figs. 1-8.

[41653] VGAM1157 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox Virus.

VGAM1157 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41654] VGAM1157 gene encodes a VGAM1157 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1157 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1157 precursor RNA is designated SEQ ID:1143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1143 is located at position 135685 relative to the genome of Camelpox Virus.

[41655] VGAM1157 precursor RNA folds onto itself, forming VGAM1157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41656] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1157 folded precursor RNA into VGAM1157 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1157 RNA is designated SEQ ID:3868, and is provided hereinbelow with reference to the sequence listing part.

[41657] VGAM1157 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1157 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41658] VGAM1157 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1157 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1157 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41659] The complementary binding of VGAM1157 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1157

host target RNA into VGAM1157 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41660] It is appreciated that VGAM1157 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1157 host target genes. The mRNA of each one of this plurality of VGAM1157 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1157 RNA, herein designated VGAM RNA, and which when bound by VGAM1157 RNA causes inhibition of translation of respective one or more VGAM1157 host target proteins.

[41661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1157 gene, herein designated VGAM GENE, on one or more VGAM1157 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41662] It is yet further appreciated that a function of VGAM1157 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1157 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1157 correlate with, and may be deduced from, the identity of the host target genes which VGAM1157 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41663] Nucleotide sequences of the VGAM1157 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1157 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1157 are further

described hereinbelow with reference to Table 1.

[41664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1157 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1157 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41665] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1157 gene, herein designated VGAM is inhibition of expression of VGAM1157 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1157 correlate with, and may be deduced from, the identity of the target genes which VGAM1157 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41666] Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180) is a VGAM1157 host target gene. NTRK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of NTRK2 BINDING SITE, designated SEQ ID:12841, to the nucleotide sequence of VGAM1157 RNA, herein designated VGAM RNA, also designated SEQ ID:3868.

[41667] A function of VGAM1157 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM1157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.LOC116143 (Accession XM_057465) is another VGAM1157 host target gene. LOC116143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116143 BINDING SITE, designated SEQ ID:36516, to the nucleotide sequence of VGAM1157 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3868.

[41668] Another function of VGAM1157 is therefore inhibition of LOC116143 (Accession XM_057465). Accordingly, utilities of VGAM1157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116143. LOC151121 (Accession XM_087102) is another VGAM1157 host target gene. LOC151121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151121 BINDING SITE, designated SEQ ID:39050, to the nucleotide sequence of VGAM1157 RNA, herein designated VGAM RNA, also designated SEQ ID:3868.

[41669] Another function of VGAM1157 is therefore inhibition of LOC151121 (Accession XM_087102). Accordingly, utilities of VGAM1157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151121. LOC203429 (Accession XM_114701) is another VGAM1157 host target gene. LOC203429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203429, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203429 BINDING SITE, designated SEQ ID:43046, to the nucleotide sequence of VGAM1157 RNA, herein designated VGAM RNA, also designated SEQ ID:3868.

[41670] Another function of VGAM1157 is therefore inhibition of LOC203429 (Accession XM_114701). Accordingly, utilities of VGAM1157 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203429. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1158 (VGAM1158) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41671] VGAM1158 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1158 was detected is described hereinabove with reference to Figs. 1-8.

[41672] VGAM1158 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox Virus.

VGAM1158 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41673] VGAM1158 gene encodes a VGAM1158 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1158 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1158 precursor RNA is designated SEQ ID:1144, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1144 is located at position 104200 relative to the genome of Swinepox Virus.

[41674] VGAM1158 precursor RNA folds onto itself, forming VGAM1158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41675] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1158 folded precursor RNA into VGAM1158 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1158 RNA is designated SEQ ID:3869, and is provided hereinbelow with reference to the sequence listing part.

[41676] VGAM1158 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1158 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41677] VGAM1158 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1158 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1158 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41678] The complementary binding of VGAM1158 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1158 host target RNA into VGAM1158 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41679] It is appreciated that VGAM1158 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1158 host target genes. The mRNA of each one of this plurality of VGAM1158 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1158 RNA, herein designated VGAM RNA, and which when bound by VGAM1158 RNA causes inhibition of translation of respective one or more VGAM1158 host target proteins.

[41680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1158 gene, herein designated VGAM GENE, on one or more VGAM1158 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41681] It is yet further appreciated that a function of VGAM1158 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of viral infection by Swinepox Virus. Specific functions, and accordingly utilities, of VGAM1158 correlate with, and may be deduced from, the identity of the host target genes which VGAM1158 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41682] Nucleotide sequences of the VGAM1158 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1158 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1158 are further described hereinbelow with reference to Table 1.

[41683] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1158 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1158 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41684] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1158 gene, herein designated VGAM is inhibition of expression of VGAM1158 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1158 correlate with, and may be deduced from, the identity of the target genes which VGAM1158 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41685] AS3 (Accession NM_015928) is a VGAM1158 host target gene. AS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AS3 BINDING SITE, designated SEQ ID:18051, to the nucleotide sequence of VGAM1158 RNA, herein

designated VGAM RNA, also designated SEQ ID:3869.

[41686] A function of VGAM1158 is therefore inhibition of AS3 (Accession NM_015928), a gene which inhibits cell proliferation. Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AS3. The function of AS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM393.Mannosidase, Alpha, Class 1A, Member 1 (MAN1A1, Accession XM_166312) is another VGAM1158 host target gene. MAN1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1A1 BINDING SITE, designated SEQ ID:44136, to the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41687] Another function of VGAM1158 is therefore inhibition of Mannosidase, Alpha, Class 1A, Member 1 (MAN1A1, Accession XM_166312), a gene which removes 3 distinct

mannose residues from peptide-bound Man(9)–GlcNAc(2) oligosaccharides. Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1A1. The function of MAN1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620) is another VGAM1158 host target gene. NOS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NOS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:6234, to the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41688] Another function of VGAM1158 is therefore inhibition of Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions throughout the body. Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with NOS1. The function of NOS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM323.UDP-GlcNAc:betaGal Beta-

1,3-N-acetylglucosaminyltransferase 1 (B3GNT1, Accession NM_006577) is another VGAM1158 host target gene.

B3GNT1 BINDING SITE1 and B3GNT1 BINDING SITE2 are

HOST TARGET binding sites found in untranslated regions

of mRNA encoded by B3GNT1, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING

SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of B3GNT1 BINDING

SITE1 and B3GNT1 BINDING SITE2, designated SEQ

ID:13344 and SEQ ID:27087 respectively, to the nu-

cleotide sequence of VGAM1158 RNA, herein designated

VGAM RNA, also designated SEQ ID:3869.

[41689] Another function of VGAM1158 is therefore inhibition of UDP-GlcNAc:betaGal Beta-

1,3-N-acetylglucosaminyltransferase 1 (B3GNT1, Accession NM_006577). Accordingly, utilities of VGAM1158 in-

clude diagnosis, prevention and treatment of diseases and

clinical conditions associated with B3GNT1. GTPBG3

(Accession NM_032620) is another VGAM1158 host target gene. GTPBG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTPBG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBG3 BINDING SITE, designated SEQ ID:26336, to the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41690] Another function of VGAM1158 is therefore inhibition of GTPBG3 (Accession NM_032620). Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBG3. KIAA0792 (Accession NM_014698) is another VGAM1158 host target gene. KIAA0792 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0792 BINDING SITE, designated SEQ ID:16213, to the nucleotide sequence of VGAM1158 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3869.

[41691] Another function of VGAM1158 is therefore inhibition of KIAA0792 (Accession NM_014698). Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0792. KIAA0979 (Accession NM_015032) is another VGAM1158 host target gene. KIAA0979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0979 BINDING SITE, designated SEQ ID:17389, to the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41692] Another function of VGAM1158 is therefore inhibition of KIAA0979 (Accession NM_015032). Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0979. KIAA0981 (Accession XM_028867) is another VGAM1158 host target gene. KIAA0981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0981, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0981 BINDING SITE, designated SEQ ID:30796, to the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41693] Another function of VGAM1158 is therefore inhibition of KIAA0981 (Accession XM_028867). Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981. KIAA1462 (Accession XM_166132) is another VGAM1158 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:43919, to the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41694] Another function of VGAM1158 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM1158 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1462. ZAK (Accession NM_016653) is another VGAM1158 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:18779, to the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41695] Another function of VGAM1158 is therefore inhibition of ZAK (Accession NM_016653). Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC138515 (Accession XM_070943) is another VGAM1158 host target gene. LOC138515 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138515 BINDING SITE, designated SEQ ID:37395, to

the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41696] Another function of VGAM1158 is therefore inhibition of LOC138515 (Accession XM_070943). Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138515. LOC254249 (Accession XM_170931) is another VGAM1158 host target gene. LOC254249 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254249 BINDING SITE, designated SEQ ID:45713, to the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, also designated SEQ ID:3869.

[41697] Another function of VGAM1158 is therefore inhibition of LOC254249 (Accession XM_170931). Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1159 (VGAM1159) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41698] VGAM1159 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1159 was detected is described hereinabove with reference to Figs. 1–8.

[41699] VGAM1159 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM1159 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41700] VGAM1159 gene encodes a VGAM1159 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1159 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1159 precursor RNA is designated SEQ ID:1145, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1145 is located at position 38413 relative to the genome of Meleagrid Herpesvirus 1.

[41701] VGAM1159 precursor RNA folds onto itself, forming VGAM1159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41702] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1159 folded precursor RNA into VGAM1159 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1159 RNA is designated SEQ ID:3870, and is provided hereinbelow with reference to the sequence listing part.

[41703] VGAM1159 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1159 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1159 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41704] VGAM1159 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1159 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1159 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41705] The complementary binding of VGAM1159 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1159 host target RNA into VGAM1159 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41706] It is appreciated that VGAM1159 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1159 host target genes. The mRNA of each one of this plurality of VGAM1159 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1159 RNA, herein designated VGAM RNA, and which when bound by VGAM1159 RNA causes inhibition of translation of respective one or more VGAM1159 host target proteins.

[41707] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1159 gene, herein designated VGAM GENE, on one or more VGAM1159 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41708] It is yet further appreciated that a function of VGAM1159 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1159 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1159 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41709] Nucleotide sequences of the VGAM1159 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1159 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1159 are further described hereinbelow with reference to Table 1.

[41710] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1159 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1159 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41711] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1159 gene, herein designated VGAM is inhibition of expression of VGAM1159 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1159 correlate with, and may be deduced from, the identity of the target genes which VGAM1159

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41712] Complement Component 7 (C7, Accession NM_000587) is a VGAM1159 host target gene. C7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7 BINDING SITE, designated SEQ ID:6191, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41713] A function of VGAM1159 is therefore inhibition of Complement Component 7 (C7, Accession NM_000587). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7. FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801) is another VGAM1159 host target gene. FKBP1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FKBP1A BINDING SITE, designated SEQ ID:6475, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41714] Another function of VGAM1159 is therefore inhibition of FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801), a gene which FK506-binding protein 1A. Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP1A. The function of FKBP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694) is another VGAM1159 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28941, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3870.

[41715] Another function of VGAM1159 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. FENS-1 (Accession NM_020830) is another VGAM1159 host target gene. FENS-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FENS-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FENS-1 BINDING SITE, designated SEQ ID:21896, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41716] Another function of VGAM1159 is therefore inhibition of FENS-1 (Accession NM_020830). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FENS-1. FLJ12592 (Accession NM_032169) is another VGAM1159 host target gene. FLJ12592 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ12592, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12592 BINDING SITE, designated SEQ ID:25874, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41717] Another function of VGAM1159 is therefore inhibition of FLJ12592 (Accession NM_032169). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12592. FLJ20079 (Accession NM_017656) is another VGAM1159 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19179, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41718] Another function of VGAM1159 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of

VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. KIAA0143 (Accession XM_035825) is another VGAM1159 host target gene. KIAA0143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0143 BINDING SITE, designated SEQ ID:32352, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41719] Another function of VGAM1159 is therefore inhibition of KIAA0143 (Accession XM_035825). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0143. KIAA0420 (Accession XM_032693) is another VGAM1159 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0420 BINDING SITE, designated SEQ ID:31726, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41720] Another function of VGAM1159 is therefore inhibition of KIAA0420 (Accession XM_032693). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. PRO2266 (Accession NM_018519) is another VGAM1159 host target gene. PRO2266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2266 BINDING SITE, designated SEQ ID:20597, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41721] Another function of VGAM1159 is therefore inhibition of PRO2266 (Accession NM_018519). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2266. SCYD1 (Accession XM_165650) is another VGAM1159 host target gene. SCYD1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by SCYD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYD1 BINDING SITE, designated SEQ ID:43713, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41722] Another function of VGAM1159 is therefore inhibition of SCYD1 (Accession XM_165650). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYD1. LOC115265 (Accession XM_055596) is another VGAM1159 host target gene. LOC115265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115265 BINDING SITE, designated SEQ ID:36310, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41723] Another function of VGAM1159 is therefore inhibition of

LOC115265 (Accession XM_055596). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115265. LOC164375 (Accession XM_104379) is another VGAM1159 host target gene. LOC164375 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164375, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164375 BINDING SITE, designated SEQ ID:42158, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41724] Another function of VGAM1159 is therefore inhibition of LOC164375 (Accession XM_104379). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164375. LOC253776 (Accession XM_173240) is another VGAM1159 host target gene. LOC253776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC253776 BINDING SITE, designated SEQ ID:46526, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41725] Another function of VGAM1159 is therefore inhibition of LOC253776 (Accession XM_173240). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253776. LOC255696 (Accession XM_173933) is another VGAM1159 host target gene. LOC255696 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255696 BINDING SITE, designated SEQ ID:46568, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41726] Another function of VGAM1159 is therefore inhibition of LOC255696 (Accession XM_173933). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255696. LOC257354 (Accession XM_170810) is an-

other VGAM1159 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45579, to the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, also designated SEQ ID:3870.

[41727] Another function of VGAM1159 is therefore inhibition of LOC257354 (Accession XM_170810). Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1160 (VGAM1160) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41728] VGAM1160 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1160 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[41729] VGAM1160 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM1160 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41730] VGAM1160 gene encodes a VGAM1160 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1160 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1160 precursor RNA is designated SEQ ID:1146, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1146 is located at position 39108 relative to the genome of Meleagrid Herpesvirus 1.

[41731] VGAM1160 precursor RNA folds onto itself, forming VGAM1160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41732] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1160 folded precursor RNA into VGAM1160 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1160 RNA is designated SEQ ID:3871, and is provided hereinbelow with reference to the sequence listing part.

[41733] VGAM1160 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1160 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41734] VGAM1160 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1160 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1160 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41735] The complementary binding of VGAM1160 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1160 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1160 host target RNA into VGAM1160 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41736] It is appreciated that VGAM1160 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1160 host target genes. The mRNA of each one of this plurality of VGAM1160 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1160 RNA, herein designated VGAM RNA, and which when bound by VGAM1160 RNA causes inhibition of translation of respective one or more VGAM1160 host target proteins.

[41737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1160 gene, herein designated VGAM GENE, on one or more VGAM1160 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41738] It is yet further appreciated that a function of VGAM1160 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1160 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1160 correlate with, and may be deduced from, the identity of the host target genes which VGAM1160 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41739] Nucleotide sequences of the VGAM1160 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1160 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1160 are further described hereinbelow with reference to Table 1.

[41740] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1160 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1160 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41741] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1160 gene, herein designated VGAM is inhibition of expression of VGAM1160 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1160 correlate with, and may be deduced from, the identity of the target genes which VGAM1160 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41742] Basic Transcription Element Binding Protein 1 (BTEB1, Accession NM_001206) is a VGAM1160 host target gene. BTEB1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BTEB1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTEB1 BINDING SITE, designated SEQ ID:6870, to the nucleotide sequence of VGAM1160 RNA, herein designated VGAM RNA, also designated SEQ ID:3871.

[41743] A function of VGAM1160 is therefore inhibition of Basic Transcription Element Binding Protein 1 (BTEB1, Accession NM_001206). Accordingly, utilities of VGAM1160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTEB1. DKFZP434I1735 (Accession XM_113763) is another VGAM1160 host target gene. DKFZP434I1735 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434I1735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I1735 BINDING SITE, designated SEQ ID:42420, to the nucleotide sequence of VGAM1160 RNA, herein designated VGAM RNA, also designated SEQ ID:3871.

[41744] Another function of VGAM1160 is therefore inhibition of DKFZP434I1735 (Accession XM_113763). Accordingly, utilities of VGAM1160 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434I1735. FLJ23598 (Accession NM_024783) is another VGAM1160 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:24154, to the nucleotide sequence of VGAM1160 RNA, herein designated VGAM RNA, also designated SEQ ID:3871.

[41745] Another function of VGAM1160 is therefore inhibition of FLJ23598 (Accession NM_024783). Accordingly, utilities of VGAM1160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. LOC149711 (Accession XM_097720) is another VGAM1160 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:41074, to

the nucleotide sequence of VGAM1160 RNA, herein designated VGAM RNA, also designated SEQ ID:3871.

[41746] Another function of VGAM1160 is therefore inhibition of LOC149711 (Accession XM_097720). Accordingly, utilities of VGAM1160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC199988 (Accession XM_117166) is another VGAM1160 host target gene. LOC199988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199988 BINDING SITE, designated SEQ ID:43268, to the nucleotide sequence of VGAM1160 RNA, herein designated VGAM RNA, also designated SEQ ID:3871.

[41747] Another function of VGAM1160 is therefore inhibition of LOC199988 (Accession XM_117166). Accordingly, utilities of VGAM1160 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199988. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1161 (VGAM1161) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41748] VGAM1161 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1161 was detected is described hereinabove with reference to Figs. 1–8.

[41749] VGAM1161 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM1161 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41750] VGAM1161 gene encodes a VGAM1161 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1161 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1161 precursor RNA is designated SEQ ID:1147, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1147 is located at position 38258 relative to the genome of Meleagrid Herpesvirus 1.

[41751] VGAM1161 precursor RNA folds onto itself, forming VGAM1161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41752] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1161 folded precursor RNA into VGAM1161 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1161 RNA is designated SEQ ID:3872, and is provided hereinbelow with reference to the sequence listing part.

[41753] VGAM1161 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1161 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1161 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[41754] VGAM1161 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1161 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1161 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41755] The complementary binding of VGAM1161 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1161 host target RNA into VGAM1161 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41756] It is appreciated that VGAM1161 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1161 host target genes. The mRNA of each one of this plurality of VGAM1161 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1161 RNA, herein designated VGAM RNA, and which when bound by VGAM1161 RNA causes inhibition of translation of respective one or more VGAM1161 host target proteins.

[41757] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1161 gene, herein designated VGAM GENE, on one or more VGAM1161 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41758] It is yet further appreciated that a function of VGAM1161 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1161 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1161 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1161 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41759] Nucleotide sequences of the VGAM1161 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1161 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1161 are further described hereinbelow with reference to Table 1.

[41760] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1161 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1161 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41761] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1161 gene, herein designated VGAM is inhibition of expression of VGAM1161 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1161 correlate with, and may be deduced from, the identity of the target genes which VGAM1161

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41762] LOC203276 (Accession XM_117523) is a VGAM1161 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43486, to the nucleotide sequence of VGAM1161 RNA, herein designated VGAM RNA, also designated SEQ ID:3872.

[41763] A function of VGAM1161 is therefore inhibition of LOC203276 (Accession XM_117523). Accordingly, utilities of VGAM1161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM_117529) is another VGAM1161 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC203305 BINDING SITE, designated SEQ ID:43510, to the nucleotide sequence of VGAM1161 RNA, herein designated VGAM RNA, also designated SEQ ID:3872.

[41764] Another function of VGAM1161 is therefore inhibition of LOC203305 (Accession XM_117529). Accordingly, utilities of VGAM1161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC254243 (Accession XM_173233) is another VGAM1161 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46512, to the nucleotide sequence of VGAM1161 RNA, herein designated VGAM RNA, also designated SEQ ID:3872.

[41765] Another function of VGAM1161 is therefore inhibition of LOC254243 (Accession XM_173233). Accordingly, utilities of VGAM1161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC90038 (Accession XM_028305) is another VGAM1161 host target gene. LOC90038 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30649, to the nucleotide sequence of VGAM1161 RNA, herein designated VGAM RNA, also designated SEQ ID:3872.

[41766] Another function of VGAM1161 is therefore inhibition of LOC90038 (Accession XM_028305). Accordingly, utilities of VGAM1161 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1162 (VGAM1162) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41767] VGAM1162 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1162 was detected is described hereinabove with reference to Figs. 1-8.

[41768] VGAM1162 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus.

VGAM1162 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41769] VGAM1162 gene encodes a VGAM1162 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1162 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1162 precursor RNA is designated SEQ ID:1148, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1148 is located at position 139277 relative to the genome of Ectromelia Virus.

[41770] VGAM1162 precursor RNA folds onto itself, forming VGAM1162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[41771] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1162 folded precursor RNA into VGAM1162 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1162 RNA is designated SEQ ID:3873, and is provided hereinbelow with reference to the sequence listing part.

[41772] VGAM1162 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1162 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1162 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41773] VGAM1162 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1162 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1162 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1162 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1162 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41774] The complementary binding of VGAM1162 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1162 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1162 host target RNA into VGAM1162 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41775] It is appreciated that VGAM1162 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1162 host target genes. The mRNA of each one of this plurality of VGAM1162 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1162 RNA, herein designated VGAM RNA, and which when bound by VGAM1162 RNA causes inhibition of translation of respective one or more VGAM1162 host target proteins.

[41776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1162 gene, herein designated VGAM GENE, on one or more VGAM1162 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41777] It is yet further appreciated that a function of VGAM1162 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1162 correlate with, and may be deduced from, the identity of the host target genes which VGAM1162 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41778] Nucleotide sequences of the VGAM1162 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1162 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1162 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1162 are further described hereinbelow with reference to Table 1.

[41779] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1162 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1162 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41780] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1162 gene, herein designated VGAM is inhibition of expression of VGAM1162 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1162 correlate with, and may be deduced from, the identity of the target genes which VGAM1162 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41781] Bullous Pemphigoid Antigen 1, 230/240kDa (BPAG1, Accession NM_015548) is a VGAM1162 host target gene. BPAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BPAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of BPAG1 BINDING SITE, designated SEQ ID:17811, to the nucleotide sequence of VGAM1162 RNA, herein designated VGAM RNA, also designated SEQ ID:3873.

[41782] A function of VGAM1162 is therefore inhibition of Bullous Pemphigoid Antigen 1, 230/240kDa (BPAG1, Accession NM_015548), a gene which plays a role in cross-linking actin to other cytoskeletal proteins, binds to microtubules. Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPAG1. The function of BPAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM494.CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838) is another VGAM1162 host target gene. CSMD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE, designated SEQ ID:36189, to the

nucleotide sequence of VGAM1162 RNA, herein designated VGAM RNA, also designated SEQ ID:3873.

[41783] Another function of VGAM1162 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838). Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. KIAA1987 (Accession XM_113870) is another VGAM1162 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42501, to the nucleotide sequence of VGAM1162 RNA, herein designated VGAM RNA, also designated SEQ ID:3873.

[41784] Another function of VGAM1162 is therefore inhibition of KIAA1987 (Accession XM_113870). Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. Leucine-rich Repeat LGI Family, Member 2 (LGI2, Accession NM_018176) is another VGAM1162 host

target gene. LGI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LGI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI2 BINDING SITE, designated SEQ ID:20002, to the nucleotide sequence of VGAM1162 RNA, herein designated VGAM RNA, also designated SEQ ID:3873.

[41785] Another function of VGAM1162 is therefore inhibition of Leucine-rich Repeat LGI Family, Member 2 (LGI2, Accession NM_018176). Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI2. VEST1 (Accession NM_052958) is another VGAM1162 host target gene. VEST1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VEST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VEST1 BINDING SITE, designated SEQ ID:27519, to the nucleotide sequence of VGAM1162 RNA, herein designated VGAM RNA, also designated SEQ

ID:3873.

[41786] Another function of VGAM1162 is therefore inhibition of VEST1 (Accession NM_052958). Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEST1. LOC145945 (Accession XM_096908) is another VGAM1162 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40638, to the nucleotide sequence of VGAM1162 RNA, herein designated VGAM RNA, also designated SEQ ID:3873.

[41787] Another function of VGAM1162 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC149013 (Accession XM_086398) is another VGAM1162 host target gene. LOC149013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149013, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149013 BINDING SITE, designated SEQ ID:38632, to the nucleotide sequence of VGAM1162 RNA, herein designated VGAM RNA, also designated SEQ ID:3873.

[41788] Another function of VGAM1162 is therefore inhibition of LOC149013 (Accession XM_086398). Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149013. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1163 (VGAM1163) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41789] VGAM1163 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1163 was detected is described hereinabove with reference to Figs. 1-8.

[41790] VGAM1163 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus.

VGAM1163 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41791] VGAM1163 gene encodes a VGAM1163 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1163 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1163 precursor RNA is designated SEQ ID:1149, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1149 is located at position 140623 relative to the genome of Ectromelia Virus.

[41792] VGAM1163 precursor RNA folds onto itself, forming VGAM1163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41793] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1163 folded precursor RNA into VGAM1163 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1163 RNA is designated SEQ ID:3874, and is provided hereinbelow with reference to the sequence listing part.

[41794] VGAM1163 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1163 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41795] VGAM1163 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1163 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1163 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41796] The complementary binding of VGAM1163 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1163 host target RNA into VGAM1163 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41797] It is appreciated that VGAM1163 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1163 host target genes. The mRNA of each one of this plurality of VGAM1163 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1163 RNA, herein designated VGAM RNA, and which when bound by VGAM1163 RNA causes inhibition of translation of respective one or more VGAM1163 host target proteins.

[41798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1163 gene, herein designated VGAM GENE, on one or more VGAM1163 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41799] It is yet further appreciated that a function of VGAM1163 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1163 correlate with, and may be deduced from, the identity of the host target genes which VGAM1163 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41800] Nucleotide sequences of the VGAM1163 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1163 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1163 are further described hereinbelow with reference to Table 1.

[41801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1163 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1163 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41802] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1163 gene, herein designated VGAM is inhibition of expression of VGAM1163 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1163 correlate with, and may be deduced from, the identity of the target genes which VGAM1163 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41803] ATPase, Class V, Type 10B (ATP10B, Accession XM_032721) is a VGAM1163 host target gene. ATP10B BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by ATP10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10B BINDING SITE, designated SEQ ID:31735, to the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41804] A function of VGAM1163 is therefore inhibition of ATPase, Class V, Type 10B (ATP10B, Accession XM_032721). Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10B. BDG-29 (Accession XM_051343) is another VGAM1163 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35815, to the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41805] Another function of VGAM1163 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of

VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. GW112 (Accession NM_006418) is another VGAM1163 host target gene. GW112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GW112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:13131, to the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41806] Another function of VGAM1163 is therefore inhibition of GW112 (Accession NM_006418). Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GW112. Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM_014424) is another VGAM1163 host target gene. HSPB7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of HSPB7 BINDING SITE, designated SEQ ID:15780, to the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41807] Another function of VGAM1163 is therefore inhibition of Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM_014424). Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPB7. KIAA1464 (Accession XM_043069) is another VGAM1163 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33882, to the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41808] Another function of VGAM1163 is therefore inhibition of KIAA1464 (Accession XM_043069). Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1464. KIAA1634 (Accession XM_032749) is another VGAM1163 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31752, to the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41809] Another function of VGAM1163 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138999) is another VGAM1163 host target gene. NETO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NETO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NETO1 BINDING SITE, designated SEQ ID:29097, to the nucleotide sequence of

VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41810] Another function of VGAM1163 is therefore inhibition of Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138999). Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NETO1. PRO2533 (Accession NM_018629) is another VGAM1163 host target gene. PRO2533 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2533 BINDING SITE, designated SEQ ID:20703, to the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41811] Another function of VGAM1163 is therefore inhibition of PRO2533 (Accession NM_018629). Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2533. LOC151201 (Accession XM_098021) is another VGAM1163 host target gene. LOC151201 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41324, to the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, also designated SEQ ID:3874.

[41812] Another function of VGAM1163 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1164 (VGAM1164) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41813] VGAM1164 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1164 was detected is described hereinabove with reference to Figs. 1-8.

[41814] VGAM1164 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM1164 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41815] VGAM1164 gene encodes a VGAM1164 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1164 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1164 precursor RNA is designated SEQ ID:1150, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1150 is located at position 135687 relative to the genome of Camelpox Virus.

[41816] VGAM1164 precursor RNA folds onto itself, forming VGAM1164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[41817] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1164 folded precursor RNA into VGAM1164 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1164 RNA is designated SEQ ID:3875, and is provided hereinbelow with reference to the sequence listing part.

[41818] VGAM1164 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1164 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1164 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41819] VGAM1164 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1164 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1164 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1164 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1164 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[41820] The complementary binding of VGAM1164 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1164 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1164 host target RNA into VGAM1164 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41821] It is appreciated that VGAM1164 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1164 host target genes. The mRNA of each one of this plurality of VGAM1164 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1164 RNA, herein designated VGAM RNA, and which when bound by VGAM1164 RNA causes inhibition of translation of respective one or more VGAM1164 host target proteins.

[41822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1164 gene, herein designated VGAM GENE, on one or more VGAM1164 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41823] It is yet further appreciated that a function of VGAM1164 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1164 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1164 correlate with, and may be deduced from, the identity of the host target genes which VGAM1164 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41824] Nucleotide sequences of the VGAM1164 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1164 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1164 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1164 are further described hereinbelow with reference to Table 1.

[41825] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1164 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1164 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41826] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1164 gene, herein designated VGAM is inhibition of expression of VGAM1164 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1164 correlate with, and may be deduced from, the identity of the target genes which VGAM1164 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41827] Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180) is a VGAM1164 host target gene. NTRK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:12841, to the nucleotide sequence of VGAM1164 RNA, herein designated VGAM RNA, also designated SEQ ID:3875.

[41828] A function of VGAM1164 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM1164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341. LOC116143 (Accession XM_057465) is another VGAM1164 host target gene. LOC116143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116143 BINDING SITE, designated SEQ ID:36516, to

the nucleotide sequence of VGAM1164 RNA, herein designated VGAM RNA, also designated SEQ ID:3875.

[41829] Another function of VGAM1164 is therefore inhibition of LOC116143 (Accession XM_057465). Accordingly, utilities of VGAM1164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116143. LOC151121 (Accession XM_087102) is another VGAM1164 host target gene. LOC151121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151121 BINDING SITE, designated SEQ ID:39050, to the nucleotide sequence of VGAM1164 RNA, herein designated VGAM RNA, also designated SEQ ID:3875.

[41830] Another function of VGAM1164 is therefore inhibition of LOC151121 (Accession XM_087102). Accordingly, utilities of VGAM1164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151121. LOC203429 (Accession XM_114701) is another VGAM1164 host target gene. LOC203429 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC203429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203429 BINDING SITE, designated SEQ ID:43046, to the nucleotide sequence of VGAM1164 RNA, herein designated VGAM RNA, also designated SEQ ID:3875.

[41831] Another function of VGAM1164 is therefore inhibition of LOC203429 (Accession XM_114701). Accordingly, utilities of VGAM1164 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203429. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1165 (VGAM1165) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41832] VGAM1165 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1165 was detected is described hereinabove with reference to Figs. 1-8.

[41833] VGAM1165 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ectromelia Virus.

VGAM1165 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41834] VGAM1165 gene encodes a VGAM1165 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1165 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1165 precursor RNA is designated SEQ ID:1151, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1151 is located at position 141338 relative to the genome of Ectromelia Virus.

[41835] VGAM1165 precursor RNA folds onto itself, forming VGAM1165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41836] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1165 folded precursor RNA into VGAM1165 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1165 RNA is designated SEQ ID:3876, and is provided hereinbelow with reference to the sequence listing part.

[41837] VGAM1165 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1165 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41838] VGAM1165 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1165 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1165 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41839] The complementary binding of VGAM1165 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1165

host target RNA into VGAM1165 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41840] It is appreciated that VGAM1165 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1165 host target genes. The mRNA of each one of this plurality of VGAM1165 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1165 RNA, herein designated VGAM RNA, and which when bound by VGAM1165 RNA causes inhibition of translation of respective one or more VGAM1165 host target proteins.

[41841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1165 gene, herein designated VGAM GENE, on one or more VGAM1165 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41842] It is yet further appreciated that a function of VGAM1165 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1165 correlate with, and may be deduced from, the identity of the host target genes which VGAM1165 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41843] Nucleotide sequences of the VGAM1165 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1165 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1165 are further

described hereinbelow with reference to Table 1.

[41844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1165 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1165 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41845] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1165 gene, herein designated VGAM is inhibition of expression of VGAM1165 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1165 correlate with, and may be deduced from, the identity of the target genes which VGAM1165 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41846] Apolipoprotein B mRNA Editing Enzyme, Catalytic Polypeptide 1 (APOBEC1, Accession NM_005889) is a VGAM1165 host target gene. APOBEC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOBEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of APOBEC1 BINDING SITE, designated SEQ ID:12508, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41847] A function of VGAM1165 is therefore inhibition of Apolipoprotein B mRNA Editing Enzyme, Catalytic Polypeptide 1 (APOBEC1, Accession NM_005889). Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOBEC1. Bridging Integrator 3 (BIN3, Accession NM_018688) is another VGAM1165 host target gene. BIN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BIN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIN3 BINDING SITE, designated SEQ ID:20762, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41848] Another function of VGAM1165 is therefore inhibition of Bridging Integrator 3 (BIN3, Accession NM_018688). Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with BIN3. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM_004397) is another VGAM1165 host target gene. DDX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX6 BINDING SITE, designated SEQ ID:10642, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41849] Another function of VGAM1165 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM_004397), a gene which is putative RNA helicases. Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX6. The function of DDX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132) is another VGAM1165 host target gene. F8 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F8 BINDING SITE, designated SEQ ID:5617, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41850] Another function of VGAM1165 is therefore inhibition of Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132). Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F8. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is another VGAM1165 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7735, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41851] Another function of VGAM1165 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944) is another VGAM1165 host target gene. PPP3CA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP3CA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CA BINDING SITE, designated SEQ ID:6645, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41852] Another function of VGAM1165 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Al-

pha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944), a gene which is the catalytic subunit of calcium-dependent, calmodulin-stimulated protein phosphatase. Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CA. The function of PPP3CA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497.RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession NM_005732) is another VGAM1165 host target gene. RAD50 BINDING SITE1 and RAD50 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD50, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE1 and RAD50 BINDING SITE2, designated SEQ ID:12297 and SEQ ID:28555 respectively, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41853] Another function of VGAM1165 is therefore inhibition of RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession

NM_005732), a gene which is involved in dna double-strand break repair (dsbr). Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD50. The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132. KIAA0268 (Accession XM_046126) is another VGAM1165 host target gene. KIAA0268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0268 BINDING SITE, designated SEQ ID:34688, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41854] Another function of VGAM1165 is therefore inhibition of KIAA0268 (Accession XM_046126). Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0268. MGC22014 (Accession XM_035307) is another VGAM1165 host target gene. MGC22014 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32222, to the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, also designated SEQ ID:3876.

[41855] Another function of VGAM1165 is therefore inhibition of MGC22014 (Accession XM_035307). Accordingly, utilities of VGAM1165 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1166 (VGAM1166) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41856] VGAM1166 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1166 was detected is described hereinabove with reference to Figs. 1-8.

[41857] VGAM1166 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Green Mottle Mosaic Virus. VGAM1166 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41858] VGAM1166 gene encodes a VGAM1166 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1166 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1166 precursor RNA is designated SEQ ID:1152, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1152 is located at position 2881 relative to the genome of Cucumber Green Mottle Mosaic Virus.

[41859] VGAM1166 precursor RNA folds onto itself, forming VGAM1166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[41860] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1166 folded precursor RNA into VGAM1166 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1166 RNA is designated SEQ ID:3877, and is provided hereinbelow with reference to the sequence listing part.

[41861] VGAM1166 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1166 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41862] VGAM1166 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1166 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1166 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1166 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[41863] The complementary binding of VGAM1166 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1166 host target RNA into VGAM1166 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41864] It is appreciated that VGAM1166 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1166 host target genes. The mRNA of each one of this plurality of VGAM1166 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1166 RNA, herein designated VGAM RNA, and which when bound by VGAM1166 RNA causes inhibition of translation of respective one or more VGAM1166 host target proteins.

[41865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1166 gene, herein designated VGAM GENE, on one or more VGAM1166 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41866] It is yet further appreciated that a function of VGAM1166 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1166 include diagnosis, prevention and treatment of viral infection by Cucumber Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1166 correlate with, and may be deduced from, the identity of the host target genes which VGAM1166 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41867] Nucleotide sequences of the VGAM1166 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1166 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1166 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1166 are further described hereinbelow with reference to Table 1.

[41868] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1166 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1166 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41869] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1166 gene, herein designated VGAM is inhibition of expression of VGAM1166 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1166 correlate with, and may be deduced from, the identity of the target genes which VGAM1166 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41870] RAD54B (Accession NM_134434) is a VGAM1166 host target gene. RAD54B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAD54B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RAD54B BINDING SITE, designated SEQ ID:28675, to the nucleotide sequence of VGAM1166 RNA, herein designated VGAM RNA, also designated SEQ ID:3877.

[41871] A function of VGAM1166 is therefore inhibition of RAD54B (Accession NM_134434), a gene which is involved in dna repair and mitotic recombination. Accordingly, utilities of VGAM1166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD54B. The function of RAD54B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595. Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM_005069) is another VGAM1166 host target gene. SIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM2 BINDING SITE, designated SEQ ID:11519, to the nucleotide sequence of VGAM1166 RNA, herein designated VGAM RNA, also designated SEQ ID:3877.

[41872] Another function of VGAM1166 is therefore inhibition of Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM_005069), a gene which may be a master gene of cns development. Accordingly, utilities of VGAM1166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM2. The function of SIM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM369. TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190) is another VGAM1166 host target gene. TAPBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9180, to the nucleotide sequence of VGAM1166 RNA, herein designated VGAM RNA, also designated SEQ ID:3877.

[41873] Another function of VGAM1166 is therefore inhibition of TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of

VGAM1166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP. The function of TAPBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM122.FHR5 (Accession NM_030787) is another VGAM1166 host target gene. FHR5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHR5 BINDING SITE, designated SEQ ID:25084, to the nucleotide sequence of VGAM1166 RNA, herein designated VGAM RNA, also designated SEQ ID:3877.

[41874] Another function of VGAM1166 is therefore inhibition of FHR5 (Accession NM_030787). Accordingly, utilities of VGAM1166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHR5. LOC145739 (Accession XM_085222) is another VGAM1166 host target gene. LOC145739 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145739, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145739 BINDING SITE, designated SEQ ID:37963, to the nucleotide sequence of VGAM1166 RNA, herein designated VGAM RNA, also designated SEQ ID:3877.

[41875] Another function of VGAM1166 is therefore inhibition of LOC145739 (Accession XM_085222). Accordingly, utilities of VGAM1166 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145739. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1167 (VGAM1167) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41876] VGAM1167 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1167 was detected is described hereinabove with reference to Figs. 1-8.

[41877] VGAM1167 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Green Mottle

Mosaic Virus. VGAM1167 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41878] VGAM1167 gene encodes a VGAM1167 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1167 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1167 precursor RNA is designated SEQ ID:1153, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1153 is located at position 2385 relative to the genome of Cucumber Green Mottle Mosaic Virus.

[41879] VGAM1167 precursor RNA folds onto itself, forming VGAM1167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41880] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1167 folded precursor RNA into VGAM1167 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1167 RNA is designated SEQ ID:3878, and is provided hereinbelow with reference to the sequence listing part.

[41881] VGAM1167 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1167 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41882] VGAM1167 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1167 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1167 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41883] The complementary binding of VGAM1167 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1167 host target RNA into VGAM1167 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41884] It is appreciated that VGAM1167 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1167 host target genes. The mRNA of each one of this plurality of VGAM1167 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1167 RNA, herein designated VGAM RNA, and which when bound by VGAM1167 RNA causes inhibition of translation of respective one or more VGAM1167 host target proteins.

[41885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1167 gene, herein designated VGAM GENE, on one or more VGAM1167 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41886] It is yet further appreciated that a function of VGAM1167 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1167 include diagnosis, prevention and treatment of viral infection by Cucumber Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1167 correlate with, and may be deduced from, the identity of the host target genes which VGAM1167 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41887] Nucleotide sequences of the VGAM1167 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1167 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1167 are further described hereinbelow with reference to Table 1.

[41888] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1167 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1167 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41889] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1167 gene, herein designated VGAM is inhibition of expression of VGAM1167 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1167 correlate with, and may be deduced from, the identity of the target genes which VGAM1167 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41890] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398) is a VGAM1167 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40337, to the nu-

cleotide sequence of VGAM1167 RNA, herein designated VGAM RNA, also designated SEQ ID:3878.

[41891] A function of VGAM1167 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM1167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444.5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870) is another VGAM1167 host target gene. HTR4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR4 BINDING SITE, designated SEQ ID:6539, to the nucleotide sequence of VGAM1167 RNA, herein designated VGAM RNA, also designated SEQ ID:3878.

[41892] Another function of VGAM1167 is therefore inhibition of

5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870), a gene which mediates calcium channel currents. Accordingly, utilities of VGAM1167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR4. The function of HTR4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65. Growth Hormone Inducible Transmembrane Protein (GHITM, Accession NM_014394) is another VGAM1167 host target gene. GHITM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GHITM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GHITM BINDING SITE, designated SEQ ID:15725, to the nucleotide sequence of VGAM1167 RNA, herein designated VGAM RNA, also designated SEQ ID:3878.

[41893] Another function of VGAM1167 is therefore inhibition of Growth Hormone Inducible Transmembrane Protein (GHITM, Accession NM_014394). Accordingly, utilities of VGAM1167 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GHITM. Makorin, Ring Finger Protein, 2 (MKRN2, Accession XM_051580) is another VGAM1167 host target gene. MKRN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKRN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN2 BINDING SITE, designated SEQ ID:35857, to the nucleotide sequence of VGAM1167 RNA, herein designated VGAM RNA, also designated SEQ ID:3878.

[41894] Another function of VGAM1167 is therefore inhibition of Makorin, Ring Finger Protein, 2 (MKRN2, Accession XM_051580). Accordingly, utilities of VGAM1167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN2. Neuropilin (NRP) and Tolloid (TLL)-like 2 (NETO2, Accession NM_018092) is another VGAM1167 host target gene. NETO2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NETO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of NETO2 BINDING SITE, designated SEQ ID:19860, to the nucleotide sequence of VGAM1167 RNA, herein designated VGAM RNA, also designated SEQ ID:3878.

[41895] Another function of VGAM1167 is therefore inhibition of Neuropilin (NRP) and Tolloid (TLL)-like 2 (NETO2, Accession NM_018092). Accordingly, utilities of VGAM1167 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NETO2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1168 (VGAM1168) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41896] VGAM1168 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1168 was detected is described hereinabove with reference to Figs. 1-8.

[41897] VGAM1168 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1168 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[41898] VGAM1168 gene encodes a VGAM1168 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1168 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1168 precursor RNA is designated SEQ ID:1154, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1154 is located at position 92139 relative to the genome of Rana Tigrina Ranavirus.

[41899] VGAM1168 precursor RNA folds onto itself, forming VGAM1168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41900] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1168 folded precursor RNA into VGAM1168 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1168 RNA is designated SEQ ID:3879, and is provided hereinbelow with reference to the sequence listing part.

[41901] VGAM1168 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1168 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41902] VGAM1168 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1168 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1168 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41903] The complementary binding of VGAM1168 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1168 host target RNA into VGAM1168 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41904] It is appreciated that VGAM1168 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1168 host target genes. The mRNA of each one of this plurality of VGAM1168 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1168 RNA, herein designated VGAM RNA, and which when bound by VGAM1168 RNA causes inhibition of translation of respective one or more VGAM1168 host target proteins.

[41905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1168 gene, herein designated VGAM GENE, on one or more VGAM1168 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41906] It is yet further appreciated that a function of VGAM1168 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1168 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1168 correlate with, and may be deduced from, the identity of the host target genes which VGAM1168 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41907] Nucleotide sequences of the VGAM1168 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1168 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1168 are further described hereinbelow with reference to Table 1.

[41908] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1168 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1168 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41909] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1168 gene, herein designated VGAM is inhibition of expression of VGAM1168 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1168 correlate with, and may be deduced from, the identity of the target genes which VGAM1168 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41910] Interleukin 2 Receptor, Alpha (IL2RA, Accession NM_000417) is a VGAM1168 host target gene. IL2RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL2RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RA BINDING SITE, designated SEQ ID:5998, to the nucleotide sequence of VGAM1168 RNA, herein designated VGAM RNA, also designated SEQ ID:3879.

[41911] A function of VGAM1168 is therefore inhibition of Interleukin 2 Receptor, Alpha (IL2RA, Accession NM_000417), a gene which plays a role in T cell mediated immune response. Accordingly, utilities of VGAM1168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RA. The function of IL2RA has been established by previous studies. The action of the T-cell growth factor interleukin-2 (IL2; 147680) requires the presence of a cell surface receptor. As most peripheral as well as thymic T cells do not carry the receptor in vivo, the regulated expression of IL2R appears to be a safeguard against a catastrophic spread of T-cell proliferation by an immunogenic stimulus. The receptor is a heterodimer, consisting of 1 alpha and 1 beta chain; the beta chain (OMIM Ref. No. 146710) was not characterized until 1989. The receptor molecule, a glycoprotein, has a relative mass of about 55,000. Its intracellular precursor is smaller. Leonard et al. (1983) used a monoclonal antibody for T-cell growth factor to characterize the receptor. Yang et al. (2001) analyzed T-cell subsets and levels of cytokine IL2 and soluble IL2 receptor in the peripheral blood of patients with normal pressure glaucoma (NPG; 606657) and primary open angle glaucoma (POAG;

137760) and compared them to values in age-matched controls. They found an increased frequency of CD8⁺/HLA-DR⁺ lymphocytes in patients with NPG and increased CD3⁺/CD8⁺ lymphocytes in both NPG and POAG patients. CD5⁺ lymphocytes were higher only in POAG patients. The mean concentration of soluble IL2R was higher in NPG and POAG patients than in controls although the IL2 concentration was similar in patients and controls. The authors concluded that the immune system might play an important role in initiation or progression of glaucomatous optic neuropathy in some patients.

[41912] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41913] Leonard, W. J.; Donlon, T. A.; Lebo, R. V.; Greene, W. C. : Localization of the gene encoding the human interleukin-2 receptor on chromosome 10. *Science* 228: 1547-1549, 1985. ; and

[41914] Yang, J.; Patil, R. V.; Yu, H.; Gordon, M.; Wax, M. B. : T cell subsets and sIL-2R/IL-2 levels in patients with glaucoma. *Am. J. Ophthal.* 131: 421-426, 2001.

[41915] Further studies establishing the function and utilities of IL2RA are found in John Hopkins OMIM database record ID

147730, and in cited publications numbered 11193–11201, 12009, 11264–11265, 680, 11266–1127 and 681 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184) is another VGAM1168 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31304, to the nucleotide sequence of VGAM1168 RNA, herein designated VGAM RNA, also designated SEQ ID:3879.

[41916] Another function of VGAM1168 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184). Accordingly, utilities of VGAM1168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1. Tripartite Motif-containing 34 (TRIM34, Accession NM_021616) is another VGAM1168 host target gene. TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRIM34, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2, designated SEQ ID:22252 and SEQ ID:28176 respectively, to the nucleotide sequence of VGAM1168 RNA, herein designated VGAM RNA, also designated SEQ ID:3879.

[41917] Another function of VGAM1168 is therefore inhibition of Tripartite Motif-containing 34 (TRIM34, Accession NM_021616). Accordingly, utilities of VGAM1168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM34. Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815) is another VGAM1168 host target gene. SLC5A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC5A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A7 BINDING SITE, designated SEQ ID:22386, to the nucleotide sequence of VGAM1168 RNA,

herein designated VGAM RNA, also designated SEQ ID:3879.

[41918] Another function of VGAM1168 is therefore inhibition of Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815). Accordingly, utilities of VGAM1168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A7. LOC56959 (Accession XM_088578) is another VGAM1168 host target gene. LOC56959 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56959 BINDING SITE, designated SEQ ID:39840, to the nucleotide sequence of VGAM1168 RNA, herein designated VGAM RNA, also designated SEQ ID:3879.

[41919] Another function of VGAM1168 is therefore inhibition of LOC56959 (Accession XM_088578). Accordingly, utilities of VGAM1168 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56959. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1169 (VGAM1169) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41920] VGAM1169 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1169 was detected is described hereinabove with reference to Figs. 1–8.

[41921] VGAM1169 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1169 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41922] VGAM1169 gene encodes a VGAM1169 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1169 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1169 precursor RNA is designated SEQ ID:1155, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1155 is located at position 92520 relative to the

genome of Rana Tigrina Ranavirus.

[41923] VGAM1169 precursor RNA folds onto itself, forming VGAM1169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41924] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1169 folded precursor RNA into VGAM1169 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1169 RNA is designated SEQ ID:3880, and is provided hereinbelow with reference to the sequence listing part.

[41925] VGAM1169 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1169 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41926] VGAM1169 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1169 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1169 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41927] The complementary binding of VGAM1169 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1169 host target RNA into VGAM1169 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41928] It is appreciated that VGAM1169 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1169 host target genes. The mRNA of each one of this plurality of VGAM1169 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1169 RNA, herein designated VGAM RNA, and which when bound by VGAM1169 RNA causes inhibition of translation of respective one or more VGAM1169 host target proteins.

[41929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1169 gene, herein designated VGAM GENE, on one or more VGAM1169 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41930] It is yet further appreciated that a function of VGAM1169 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1169

correlate with, and may be deduced from, the identity of the host target genes which VGAM1169 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41931] Nucleotide sequences of the VGAM1169 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1169 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1169 are further described hereinbelow with reference to Table 1.

[41932] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1169 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1169 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41933] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1169 gene, herein designated VGAM is inhibition of expression of VGAM1169 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1169 correlate with, and may be deduced

from, the identity of the target genes which VGAM1169 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41934] ACK1 (Accession NM_005781) is a VGAM1169 host target gene. ACK1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ACK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACK1 BINDING SITE, designated SEQ ID:12361, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41935] A function of VGAM1169 is therefore inhibition of ACK1 (Accession NM_005781). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACK1. A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 13 (ADAMTS13, Accession NM_139028) is another VGAM1169 host target gene. ADAMTS13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAMTS13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS13 BINDING SITE, designated SEQ ID:29130, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41936] Another function of VGAM1169 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 13 (ADAMTS13, Accession NM_139028), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS13. The function of ADAMTS13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Adenylate Cyclase 8 (brain) (ADCY8, Accession NM_001115) is another VGAM1169 host target gene. ADCY8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADCY8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ADCY8 BINDING SITE, designated SEQ ID:6789, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41937] Another function of VGAM1169 is therefore inhibition of Adenylate Cyclase 8 (brain) (ADCY8, Accession NM_001115), a gene which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY8. The function of ADCY8 has been established by previous studies. Adenylyl cyclase (EC 4.6.1.1) catalyzes the transformation of ATP into cyclic AMP. The enzymatic activity is under the control of several hormones, and different polypeptides participate in the transduction of the signal from the receptor to the catalytic moiety. Stimulatory or inhibitory receptors (R_s and R_i) interact with G proteins (G_s and G_i) that exhibit GTPase activity and they modulate the activity of the catalytic subunit of the adenylyl cyclase. Parma et al. (1991) cloned a cDNA corresponding to human brain adenylyl cyclase, symbolized by them as HBAC1. By in situ hybridization to metaphase chromosomal spreads using the human brain cDNA probe,

Stengel et al. (1992) showed that the gene is located on 8q24.2. A highly homologous gene, ADCY2 (OMIM Ref. No. 103071), was assigned to 5p15.3 by the same method.

[41938] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41939] Parma, J.; Stengel, D.; Gannage, M.–H.; Poyard, M.; Barouki, R.; Hanoune, J. : Sequence of a human brain adenylyl cyclase partial cDNA: evidence for a consensus cyclase domain. Biochem. Biophys. Res. Commun. 179: 455–462, 1991. ; and

[41940] Stengel, D.; Parma, J.; Gannage, M.–H.; Roeckel, N.; Mattei, M.–G.; Barouki, R.; Hanoune, J. : Different chromosomal localization of two adenylyl cyclase genes expressed in human brain.

[41941] Further studies establishing the function and utilities of ADCY8 are found in John Hopkins OMIM database record ID 103070, and in cited publications numbered 492–493 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cell Division Cycle 2–like 2 (CDC2L2, Accession NM_033532) is another VGAM1169 host target gene. CDC2L2 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDC2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC2L2 BINDING SITE, designated SEQ ID:27300, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41942] Another function of VGAM1169 is therefore inhibition of Cell Division Cycle 2-like 2 (CDC2L2, Accession NM_033532). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC2L2. Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM_013372) is another VGAM1169 host target gene. CKTSF1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKTSF1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKTSF1B1 BINDING SITE, designated SEQ ID:15025, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ

ID:3880.

[41943] Another function of VGAM1169 is therefore inhibition of Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM_013372), a gene which blocks signaling of bone morphogenetic protein (BMP) . Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKTSF1B1. The function of CKTSF1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. CAMP Responsive Element Binding Protein 1 (CREB1, Accession NM_004379) is another VGAM1169 host target gene. CREB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREB1 BINDING SITE, designated SEQ ID:10601, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41944] Another function of VGAM1169 is therefore inhibition of CAMP Responsive Element Binding Protein 1 (CREB1, Ac-

cession NM_004379), a gene which regulates expression of cAMP-inducible genes. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREB1. The function of CREB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497.D Site of Albumin Promoter (albumin D-box) Binding Protein (DBP, Accession NM_001352) is another VGAM1169 host target gene. DBP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBP BINDING SITE, designated SEQ ID:7031, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41945] Another function of VGAM1169 is therefore inhibition of D Site of Albumin Promoter (albumin D-box) Binding Protein (DBP, Accession NM_001352), a gene which generates macrophage-activating factor and enhances ingestion activity of macrophages. Accordingly, utilities of VGAM1169

include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBP. The function of DBP has been established by previous studies. Yamamoto and Homma (1991) presented evidence from studies in mice that vitamin D-3 binding protein is a precursor for the macrophage-activating factor, that it is converted by the membrane glycosidases of B and T cells to the macrophage-activating factor, and that enzymatic conversion of Gc protein to the macrophage-activating factor can occur in vitro. In vitro treatment of mouse peritoneal adherent cells (macrophages) alone with lysophosphatidylcholine or dodecylglycerol results in no enhanced ingestion activity of macrophages. However, incubation of peritoneal cells with these agents in serum-supplemented medium results in greatly enhanced phagocytic activity. Gc is the serum factor responsible for this. The role of Gc in this function suggests possible mechanisms for maintenance of the Gc polymorphism. Along with gelsolin (OMIM Ref. No. 137350), the Gc protein binds actin, which is released into the circulation with cell necrosis. This is the so-called extracellular actin-scavenger system which prevents toxic effects of actin. By immunoelectrophoresis, Hirschfeld (1959) discovered polymorphism of the serum

alpha-2-globulin called Gc for group-specific component. Gc1-1, Gc2-2, and Gc2-1 phenotypes can be distinguished also by starch or agar electrophoresis (Bearn et al., 1964). In the same year that Gc proteins were reported, another human plasma protein, vitamin D-binding alpha-globulin (VDBG), was described. Daiger et al. (1975) demonstrated that Gc and VDBG are identical. The worldwide polymorphism of Gc is now not surprising. Mourant et al. (1976) concluded that high frequency of the Gc(2) allele corresponds, with some exceptions, to low levels of sunlight. Within Ireland, the correlation did not hold. By a novel method of labeling Gc protein with radioactive vitamin D, followed with electrophoresis and autoradiography, Daiger and Cavalli-Sforza (1977) detected new Gc variants. The gene frequency of some of the variants was as high as 15%. They were testing a physiologically relevant property of the Gc protein. In Iceland, Karlsson et al. (1980) used immunofixation electrophoresis for Gc typing according to the method of Johnson et al. (1975). They found a new variant first thought to be identical to Gc Norway but later shown to be distinct.

[41946] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [41947] Kofler, A.; Braun, A.; Jenkins, T.; Serjeantson, S. W.; Cleve, H. : Characterization of mutants of the vitamin-D-binding protein/group specific component: GC Aborigine (1A1) from Australian Aborigines and South African blacks, and 2A9 from South Germany. *Vox Sang.* 68: 50–54, 1995. ; and
- [41948] Yamamoto, N.; Homma, S. : Vitamin D-3 binding protein (group-specific component) is a precursor for the macrophage-activating signal factor from lysophosphatidylcholine-treated lymphocy.
- [41949] Further studies establishing the function and utilities of DBP are found in John Hopkins OMIM database record ID 139200, and in cited publications numbered 1563–1564, 3785–1567, 3063–3087, 3652–3094, 3362, 378 and 3363–3379 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Deleted
In Lung and Esophageal Cancer 1 (DLEC1, Accession NM_007336) is another VGAM1169 host target gene.
DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLEC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEC1 BINDING SITE1 and DLEC1 BINDING SITE2, designated SEQ ID:14266 and SEQ ID:14273 respectively, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41950] Another function of VGAM1169 is therefore inhibition of Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM_007336). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLEC1. Dishevelled, Dsh Homolog 1 (Drosophila) (DVL1, Accession XM_001589) is another VGAM1169 host target gene. DVL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL1 BINDING SITE, designated SEQ ID:29844, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41951] Another function of VGAM1169 is therefore inhibition of Dishevelled, Dsh Homolog 1 (Drosophila) (DVL1, Acces-

sion XM_001589), a gene which may play a role in the signal transduction pathway . Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL1. The function of DVL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Frizzled-related Protein (FRZB, Accession NM_001463) is another VGAM1169 host target gene. FRZB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FRZB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRZB BINDING SITE, designated SEQ ID:7198, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41952] Another function of VGAM1169 is therefore inhibition of Frizzled-related Protein (FRZB, Accession NM_001463), a gene which may be involved in morphogenesis of skeleton. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRZB. The function of FRZB has been

established by previous studies. Transplantation experiments by Spemann and Mangold (1924) established the presence of an anatomically discrete region, the Spemann organizer, or dorsal lip, that controls patterning of the developing body axis in vertebrate embryos. Diffusible factors emanating from this region, such as 'goosecoid' (GSC; 138890) and 'noggin' (NOG; 602991), regulate skeletal morphogenesis. *Drosophila* cuticle hairs are arranged in a defined polarity that is genetically controlled by 'frizzled' (see OMIM Ref. No. FZD1; 603408), a 7-transmembrane receptor with a large extracellular cysteine-rich domain (CRD).

[41953] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41954] Leyns, L.; Bouwmeester, T.; Kim, S.-H.; Piccolo, S.; De Robertis, E. M. : Frzb-1 is a secreted antagonist of Wnt signaling expressed in the Spemann organizer. *Cell* 88: 747-756, 1997. ; and

[41955] Spemann, H.; Mangold, H. : Ueber induktion von embryonalanlagen durch implantation artfremder organisatoren. *Arch. Mikroskopische Anat. Entwicklungsmechanik* 100: 599-638, 1924.

[41956] Further studies establishing the function and utilities of FRZB are found in John Hopkins OMIM database record ID 605083, and in cited publications numbered 6601–6603, 42 and 6604 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Frizzled Homolog 8 (Drosophila) (FZD8, Accession NM_031866) is another VGAM1169 host target gene. FZD8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD8 BINDING SITE, designated SEQ ID:25625, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41957] Another function of VGAM1169 is therefore inhibition of Frizzled Homolog 8 (Drosophila) (FZD8, Accession NM_031866), a gene which may be involved in transduction and intercellular transmission of polarity information during tissue morphogenesis and/or in differentiated tissues. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD8. The function of FZD8 and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM503. Growth Arrest-specific 7 (GAS7, Accession NM_003644) is another VGAM1169 host target gene. GAS7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAS7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAS7 BINDING SITE, designated SEQ ID:9717, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41958] Another function of VGAM1169 is therefore inhibition of Growth Arrest-specific 7 (GAS7, Accession NM_003644), a gene which may play a role in promoting maturation and morphological differentiation of cerebellar neurons. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS7. The function of GAS7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Gap Junction Protein,

Beta 3, 31kDa (connexin 31) (GJB3, Accession NM_024009) is another VGAM1169 host target gene. GJB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GJB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJB3 BINDING SITE, designated SEQ ID:23440, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41959] Another function of VGAM1169 is therefore inhibition of Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM_024009). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB3. Golgi Reassembly Stacking Protein 1, 65kDa (GORASP1, Accession NM_031899) is another VGAM1169 host target gene. GORASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GORASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GORASP1 BINDING SITE, designated

SEQ ID:25647, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41960] Another function of VGAM1169 is therefore inhibition of Golgi Reassembly Stacking Protein 1, 65kDa (GORASP1, Accession NM_031899), a gene which has some function with the Golgi apparatus. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GORASP1. The function of GORASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM630. Leucine Zipper Protein 1 (LUZP1, Accession NM_033631) is another VGAM1169 host target gene. LUZP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LUZP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LUZP1 BINDING SITE, designated SEQ ID:27350, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41961] Another function of VGAM1169 is therefore inhibition of Leucine Zipper Protein 1 (LUZP1, Accession NM_033631). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LUZP1. Matrix Metalloproteinase 8 (neutrophil collagenase) (MMP8, Accession NM_002424) is another VGAM1169 host target gene. MMP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MMP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP8 BINDING SITE, designated SEQ ID:8259, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41962] Another function of VGAM1169 is therefore inhibition of Matrix Metalloproteinase 8 (neutrophil collagenase) (MMP8, Accession NM_002424). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP8. Myelin Protein Zero (Charcot-Marie-Tooth neuropathy 1B) (MPZ, Accession NM_000530) is another VGAM1169 host target gene. MPZ BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by MPZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPZ BINDING SITE, designated SEQ ID:6131, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41963] Another function of VGAM1169 is therefore inhibition of Myelin Protein Zero (Charcot-Marie-Tooth neuropathy 1B) (MPZ, Accession NM_000530). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPZ. Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Beta Polypeptide (protein disulfide isomerase; thyroid hormone binding protein p55) (P4HB, Accession NM_000918) is another VGAM1169 host target gene. P4HB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P4HB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P4HB BINDING SITE, designated SEQ ID:6629, to the nucleotide sequence of VGAM1169 RNA,

herein designated VGAM RNA, also designated SEQ ID:3880.

[41964] Another function of VGAM1169 is therefore inhibition of Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Beta Polypeptide (protein disulfide isomerase; thyroid hormone binding protein p55) (P4HB, Accession NM_000918), a gene which catalyzes formation of 4-hydroxyproline in collagens. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HB. The function of P4HB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM589. RAD54B (Accession NM_134434) is another VGAM1169 host target gene. RAD54B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAD54B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD54B BINDING SITE, designated SEQ ID:28677, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41965] Another function of VGAM1169 is therefore inhibition of RAD54B (Accession NM_134434), a gene which is involved in dna repair and mitotic recombination. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD54B. The function of RAD54B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595. RB1-inducible Coiled-coil 1 (RB1CC1, Accession NM_014781) is another VGAM1169 host target gene. RB1CC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RB1CC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RB1CC1 BINDING SITE, designated SEQ ID:16631, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41966] Another function of VGAM1169 is therefore inhibition of RB1-inducible Coiled-coil 1 (RB1CC1, Accession NM_014781), a gene which is likely to participate in nuclear architecture by connecting chromatin with the nu-

clear matrix or envelope. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RB1CC1. The function of RB1CC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18. Reelin (RELN, Accession XM_168628) is another VGAM1169 host target gene. RELN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RELN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RELN BINDING SITE, designated SEQ ID:45278, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41967] Another function of VGAM1169 is therefore inhibition of Reelin (RELN, Accession XM_168628), a gene which regulates microtubule function in neurons and neuronal migration. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RELN. The function of RELN and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM35.SRY (sex determining region Y)-box 4 (SOX4, Accession

NM_003107) is another VGAM1169 host target gene.

SOX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9075, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41968] Another function of VGAM1169 is therefore inhibition of SRY (sex determining region Y)-box 4 (SOX4, Accession NM_003107), a gene which binds with high affinity to the t-cell enhancer motif 5'-aacaag-3' motif. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4. The function of SOX4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM409.Stanniocalcin 1 (STC1, Accession NM_003155) is another VGAM1169 host target gene.

STC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STC1 BINDING SITE, designated SEQ ID:9136, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41969] Another function of VGAM1169 is therefore inhibition of Stanniocalcin 1 (STC1, Accession NM_003155), a gene which stimulates renal phosphate reabsorption, and could therefore prevent hypercalcemia. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STC1. The function of STC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM623. Transforming Growth Factor, Alpha (TGFA, Accession NM_003236) is another VGAM1169 host target gene. TGFA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:9231, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41970] Another function of VGAM1169 is therefore inhibition of Transforming Growth Factor, Alpha (TGFA, Accession NM_003236), a gene which is able to bind to the egf receptor and to act synergistically with tgfbeta to promote anchorage-independent cell proliferation in soft agar. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA. The function of TGFA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM328. T-cell Lymphoma Invasion and Metastasis 1 (TIAM1, Accession NM_003253) is another VGAM1169 host target gene. TIAM1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAM1 BINDING SITE, designated SEQ ID:9261, to the nucleotide se-

quence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41971] Another function of VGAM1169 is therefore inhibition of T-cell Lymphoma Invasion and Metastasis 1 (TIAM1, Accession NM_003253), a gene which modulates the activity of Rho-like proteins and connects extracellular signals to cytoskeletal activities. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAM1. The function of TIAM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1098. Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM_003257) is another VGAM1169 host target gene. TJP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TJP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP1 BINDING SITE, designated SEQ ID:9265, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41972] Another function of VGAM1169 is therefore inhibition of

Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM_003257), a gene which colocalizes and interacts with cadherins in cells lacking tight junctions. Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP1. The function of TJP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. A Kinase (PRKA) Anchor Protein 8 (AKAP8, Accession NM_005858) is another VGAM1169 host target gene. AKAP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP8 BINDING SITE, designated SEQ ID:12465, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41973] Another function of VGAM1169 is therefore inhibition of A Kinase (PRKA) Anchor Protein 8 (AKAP8, Accession NM_005858). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with AKAP8. Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM_001716) is another VGAM1169 host target gene. BLR1 BINDING SITE1 and BLR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BLR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLR1 BINDING SITE1 and BLR1 BINDING SITE2, designated SEQ ID:7447 and SEQ ID:26777 respectively, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41974] Another function of VGAM1169 is therefore inhibition of Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM_001716). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLR1. Chloride Intracellular Channel 2 (CLIC2, Accession NM_001289) is another VGAM1169 host target gene. CLIC2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CLIC2, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC2 BINDING SITE, designated SEQ ID:6967, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41975] Another function of VGAM1169 is therefore inhibition of Chloride Intracellular Channel 2 (CLIC2, Accession NM_001289). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC2. Cyclin M2 (CNNM2, Accession NM_017649) is another VGAM1169 host target gene. CNNM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM2 BINDING SITE, designated SEQ ID:19155, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41976] Another function of VGAM1169 is therefore inhibition of Cyclin M2 (CNNM2, Accession NM_017649). Accordingly,

utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM2. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM_014681) is another VGAM1169 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16165, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41977] Another function of VGAM1169 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM_014681). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 35 (DDX35, Accession NM_021931) is another VGAM1169 host target gene. DDX35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX35, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX35 BINDING SITE, designated SEQ ID:22454, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41978] Another function of VGAM1169 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 35 (DDX35, Accession NM_021931). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX35. DKFZP434L187 (Accession XM_044070) is another VGAM1169 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34121, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41979] Another function of VGAM1169 is therefore inhibition of

DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. DKFZP434N178 (Accession XM_050278) is another VGAM1169 host target gene. DKFZP434N178 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434N178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N178 BINDING SITE, designated SEQ ID:35598, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41980] Another function of VGAM1169 is therefore inhibition of DKFZP434N178 (Accession XM_050278). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N178. DKFZP586I2223 (Accession NM_015438) is another VGAM1169 host target gene. DKFZP586I2223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586I2223, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE, designated SEQ ID:17732, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41981] Another function of VGAM1169 is therefore inhibition of DKFZP586I2223 (Accession NM_015438). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223. FLJ13710 (Accession NM_024817) is another VGAM1169 host target gene. FLJ13710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:24206, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41982] Another function of VGAM1169 is therefore inhibition of FLJ13710 (Accession NM_024817). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13710. FLJ20154 (Accession XM_053688) is another VGAM1169 host target gene. FLJ20154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20154 BINDING SITE, designated SEQ ID:36106, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41983] Another function of VGAM1169 is therefore inhibition of FLJ20154 (Accession XM_053688). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20154. GS3955 (Accession NM_021643) is another VGAM1169 host target gene. GS3955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GS3955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GS3955 BINDING SITE, designated SEQ ID:22305, to the nucleotide

sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41984] Another function of VGAM1169 is therefore inhibition of GS3955 (Accession NM_021643). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GS3955. KIAA0296 (Accession NM_014699) is another VGAM1169 host target gene. KIAA0296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:16222, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41985] Another function of VGAM1169 is therefore inhibition of KIAA0296 (Accession NM_014699). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296. KIAA0337 (Accession NM_014786) is another VGAM1169 host target gene. KIAA0337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0337 BINDING SITE, designated SEQ ID:16655, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41986] Another function of VGAM1169 is therefore inhibition of KIAA0337 (Accession NM_014786). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0337. KIAA0415 (Accession XM_166527) is another VGAM1169 host target gene. KIAA0415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0415 BINDING SITE, designated SEQ ID:44477, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41987] Another function of VGAM1169 is therefore inhibition of KIAA0415 (Accession XM_166527). Accordingly, utilities

of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0415. KIAA0472 (Accession XM_050147) is another VGAM1169 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35580, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41988] Another function of VGAM1169 is therefore inhibition of KIAA0472 (Accession XM_050147). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. KIAA0668 (Accession XM_039332) is another VGAM1169 host target gene. KIAA0668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0668 BINDING SITE, designated SEQ ID:33053, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41989] Another function of VGAM1169 is therefore inhibition of KIAA0668 (Accession XM_039332). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0668. KIAA1023 (Accession NM_017604) is another VGAM1169 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19090, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41990] Another function of VGAM1169 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1184 (Accession NM_022572) is another VGAM1169 host target gene. KIAA1184 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1184 BINDING SITE, designated SEQ ID:22893, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41991] Another function of VGAM1169 is therefore inhibition of KIAA1184 (Accession NM_022572). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1184. KIAA1374 (Accession XM_028413) is another VGAM1169 host target gene. KIAA1374 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1374, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1374 BINDING SITE, designated SEQ ID:30709, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41992] Another function of VGAM1169 is therefore inhibition of

KIAA1374 (Accession XM_028413). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1374. KIAA1464 (Accession XM_043069) is another VGAM1169 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33884, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41993] Another function of VGAM1169 is therefore inhibition of KIAA1464 (Accession XM_043069). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. KIAA1674 (Accession XM_044065) is another VGAM1169 host target gene. KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34113, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41994] Another function of VGAM1169 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. LPS-responsive Vesicle Trafficking, Beach and Anchor Containing (LRBA, Accession NM_006726) is another VGAM1169 host target gene. LRBA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRBA BINDING SITE, designated SEQ ID:13557, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41995] Another function of VGAM1169 is therefore inhibition of LPS-responsive Vesicle Trafficking, Beach and Anchor Containing (LRBA, Accession NM_006726). Accordingly, utilities of VGAM1169 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with LRBA. MAGE-E1 (Accession NM_030801) is another VGAM1169 host target gene. MAGE-E1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAGE-E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGE-E1 BINDING SITE, designated SEQ ID:25108, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41996] Another function of VGAM1169 is therefore inhibition of MAGE-E1 (Accession NM_030801). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGE-E1. MDS006 (Accession NM_020233) is another VGAM1169 host target gene. MDS006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDS006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS006 BINDING SITE, designated SEQ ID:21502, to the nucleotide

sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41997] Another function of VGAM1169 is therefore inhibition of MDS006 (Accession NM_020233). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS006. MGC2663 (Accession NM_024106) is another VGAM1169 host target gene. MGC2663 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2663 BINDING SITE, designated SEQ ID:23551, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41998] Another function of VGAM1169 is therefore inhibition of MGC2663 (Accession NM_024106). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2663. MGC33371 (Accession NM_144664) is another VGAM1169 host target gene. MGC33371 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by MGC33371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC33371 BINDING SITE, designated SEQ ID:29480, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[41999] Another function of VGAM1169 is therefore inhibition of MGC33371 (Accession NM_144664). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC33371. MAP Kinase-interacting Serine/threonine Kinase 1 (MKNK1, Accession NM_003684) is another VGAM1169 host target gene. MKNK1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MKNK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKNK1 BINDING SITE, designated SEQ ID:9794, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42000] Another function of VGAM1169 is therefore inhibition of

MAP Kinase–interacting Serine/threonine Kinase 1 (MKNK1, Accession NM_003684). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKNK1. Matrix Metalloproteinase–like 1 (MMPL1, Accession NM_004142) is another VGAM1169 host target gene. MMPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMPL1 BINDING SITE, designated SEQ ID:10348, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42001] Another function of VGAM1169 is therefore inhibition of Matrix Metalloproteinase–like 1 (MMPL1, Accession NM_004142). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMPL1. N4BP3 (Accession XM_038920) is another VGAM1169 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by N4BP3,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32930, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42002] Another function of VGAM1169 is therefore inhibition of N4BP3 (Accession XM_038920). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. NAG14 (Accession NM_022143) is another VGAM1169 host target gene. NAG14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAG14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAG14 BINDING SITE, designated SEQ ID:22705, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42003] Another function of VGAM1169 is therefore inhibition of NAG14 (Accession NM_022143). Accordingly, utilities of

VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAG14. PIP3-E (Accession XM_039749) is another VGAM1169 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33180, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42004] Another function of VGAM1169 is therefore inhibition of PIP3-E (Accession XM_039749). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792) is another VGAM1169 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28055, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42005] Another function of VGAM1169 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. RAN Binding Protein 8 (RANBP8, Accession NM_006390) is another VGAM1169 host target gene. RANBP8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RANBP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP8 BINDING SITE, designated SEQ ID:13094, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42006] Another function of VGAM1169 is therefore inhibition of RAN Binding Protein 8 (RANBP8, Accession NM_006390). Accordingly, utilities of VGAM1169 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with RANBP8. Small Nuclear Ribonucleoprotein D1 Polypeptide 16kDa (SNRPD1, Accession NM_006938) is another VGAM1169 host target gene. SNRPD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNRPD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNRPD1 BINDING SITE, designated SEQ ID:13821, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42007] Another function of VGAM1169 is therefore inhibition of Small Nuclear Ribonucleoprotein D1 Polypeptide 16kDa (SNRPD1, Accession NM_006938). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRPD1. TED (Accession NM_015686) is another VGAM1169 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17920, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42008] Another function of VGAM1169 is therefore inhibition of TED (Accession NM_015686). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. TU12B1-TY (Accession NM_016575) is another VGAM1169 host target gene. TU12B1-TY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TU12B1-TY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:18648, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42009] Another function of VGAM1169 is therefore inhibition of TU12B1-TY (Accession NM_016575). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

TU12B1-TY. UBCE7IP5 (Accession NM_014948) is another VGAM1169 host target gene. UBCE7IP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBCE7IP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBCE7IP5 BINDING SITE, designated SEQ ID:17273, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42010] Another function of VGAM1169 is therefore inhibition of UBCE7IP5 (Accession NM_014948). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBCE7IP5. LOC127294 (Accession XM_059131) is another VGAM1169 host target gene. LOC127294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127294 BINDING SITE, designated SEQ ID:36894, to the nucleotide sequence of VGAM1169 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3880.

[42011] Another function of VGAM1169 is therefore inhibition of LOC127294 (Accession XM_059131). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127294. LOC129676 (Accession XM_065341) is another VGAM1169 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37285, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42012] Another function of VGAM1169 is therefore inhibition of LOC129676 (Accession XM_065341). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129676. LOC138389 (Accession XM_072534) is another VGAM1169 host target gene. LOC138389 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC138389, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138389 BINDING SITE, designated SEQ ID:37507, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42013] Another function of VGAM1169 is therefore inhibition of LOC138389 (Accession XM_072534). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138389. LOC144970 (Accession XM_084998) is another VGAM1169 host target gene. LOC144970 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144970 BINDING SITE, designated SEQ ID:37793, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42014] Another function of VGAM1169 is therefore inhibition of LOC144970 (Accession XM_084998). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC144970. LOC145623 (Accession XM_096822) is another VGAM1169 host target gene. LOC145623 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145623 BINDING SITE, designated SEQ ID:40545, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42015] Another function of VGAM1169 is therefore inhibition of LOC145623 (Accession XM_096822). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145623. LOC146520 (Accession XM_085492) is another VGAM1169 host target gene. LOC146520 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:38186, to

the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42016] Another function of VGAM1169 is therefore inhibition of LOC146520 (Accession XM_085492). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC147912 (Accession XM_085952) is another VGAM1169 host target gene. LOC147912 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147912 BINDING SITE, designated SEQ ID:38418, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42017] Another function of VGAM1169 is therefore inhibition of LOC147912 (Accession XM_085952). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147912. LOC148946 (Accession XM_097557) is another VGAM1169 host target gene. LOC148946 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC148946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148946 BINDING SITE, designated SEQ ID:40940, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42018] Another function of VGAM1169 is therefore inhibition of LOC148946 (Accession XM_097557). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148946. LOC151009 (Accession XM_097992) is another VGAM1169 host target gene. LOC151009 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151009 BINDING SITE, designated SEQ ID:41289, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42019] Another function of VGAM1169 is therefore inhibition of LOC151009 (Accession XM_097992). Accordingly, utilities

of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151009. LOC152283 (Accession XM_098196) is another VGAM1169 host target gene. LOC152283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152283 BINDING SITE, designated SEQ ID:41487, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42020] Another function of VGAM1169 is therefore inhibition of LOC152283 (Accession XM_098196). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152283. LOC155179 (Accession XM_088169) is another VGAM1169 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC155179 BINDING SITE, designated SEQ ID:39557, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42021] Another function of VGAM1169 is therefore inhibition of LOC155179 (Accession XM_088169). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC164714 (Accession XM_104657) is another VGAM1169 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42182, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42022] Another function of VGAM1169 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC196047 (Accession XM_116883) is another VGAM1169 host target gene. LOC196047 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196047 BINDING SITE, designated SEQ ID:43143, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42023] Another function of VGAM1169 is therefore inhibition of LOC196047 (Accession XM_116883). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196047. LOC196472 (Accession XM_113727) is another VGAM1169 host target gene. LOC196472 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196472 BINDING SITE, designated SEQ ID:42375, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42024] Another function of VGAM1169 is therefore inhibition of

LOC196472 (Accession XM_113727). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196472. LOC199858 (Accession XM_114040) is another VGAM1169 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42639, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42025] Another function of VGAM1169 is therefore inhibition of LOC199858 (Accession XM_114040). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC200597 (Accession XM_114266) is another VGAM1169 host target gene. LOC200597 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC200597 BINDING SITE, designated SEQ ID:42825, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42026] Another function of VGAM1169 is therefore inhibition of LOC200597 (Accession XM_114266). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200597. LOC203636 (Accession XM_114868) is another VGAM1169 host target gene. LOC203636 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203636, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203636 BINDING SITE, designated SEQ ID:43077, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42027] Another function of VGAM1169 is therefore inhibition of LOC203636 (Accession XM_114868). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203636. LOC219686 (Accession XM_165544) is an-

other VGAM1169 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:43674, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42028] Another function of VGAM1169 is therefore inhibition of LOC219686 (Accession XM_165544). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219686. LOC219899 (Accession XM_166173) is another VGAM1169 host target gene. LOC219899 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219899 BINDING SITE, designated SEQ ID:43989, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42029] Another function of VGAM1169 is therefore inhibition of LOC219899 (Accession XM_166173). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219899. LOC220018 (Accession XM_167816) is another VGAM1169 host target gene. LOC220018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220018 BINDING SITE, designated SEQ ID:44856, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42030] Another function of VGAM1169 is therefore inhibition of LOC220018 (Accession XM_167816). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220018. LOC220906 (Accession XM_166133) is another VGAM1169 host target gene. LOC220906 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220906, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220906 BINDING SITE, designated SEQ ID:43926, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42031] Another function of VGAM1169 is therefore inhibition of LOC220906 (Accession XM_166133). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220906. LOC222486 (Accession XM_169432) is another VGAM1169 host target gene. LOC222486 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222486 BINDING SITE, designated SEQ ID:45300, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42032] Another function of VGAM1169 is therefore inhibition of LOC222486 (Accession XM_169432). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC222486. LOC254532 (Accession XM_172961) is another VGAM1169 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46212, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42033] Another function of VGAM1169 is therefore inhibition of LOC254532 (Accession XM_172961). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC256950 (Accession XM_170922) is another VGAM1169 host target gene. LOC256950 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256950 BINDING SITE, designated SEQ ID:45701, to the nucleotide sequence of VGAM1169 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3880.

[42034] Another function of VGAM1169 is therefore inhibition of LOC256950 (Accession XM_170922). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256950. LOC92299 (Accession XM_044075) is another VGAM1169 host target gene. LOC92299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92299 BINDING SITE, designated SEQ ID:34131, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42035] Another function of VGAM1169 is therefore inhibition of LOC92299 (Accession XM_044075). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92299. LOC92973 (Accession XM_048529) is another VGAM1169 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92973, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35185, to the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, also designated SEQ ID:3880.

[42036] Another function of VGAM1169 is therefore inhibition of LOC92973 (Accession XM_048529). Accordingly, utilities of VGAM1169 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1170 (VGAM1170) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42037] VGAM1170 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1170 was detected is described hereinabove with reference to Figs. 1-8.

[42038] VGAM1170 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Melanoplus Sanguinipes*

Entomopoxvirus. VGAM1170 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42039] VGAM1170 gene encodes a VGAM1170 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1170 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1170 precursor RNA is designated SEQ ID:1156, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1156 is located at position 35824 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[42040] VGAM1170 precursor RNA folds onto itself, forming VGAM1170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42041] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1170 folded precursor RNA into VGAM1170 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1170 RNA is designated SEQ ID:3881, and is provided hereinbelow with reference to the sequence listing part.

[42042] VGAM1170 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1170 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42043] VGAM1170 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1170 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1170 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42044] The complementary binding of VGAM1170 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1170 host target RNA into VGAM1170 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42045] It is appreciated that VGAM1170 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1170 host target genes. The mRNA of each one of this plurality of VGAM1170 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1170 RNA, herein designated VGAM RNA, and which when bound by VGAM1170 RNA causes inhibition of translation of respective one or more VGAM1170 host target proteins.

[42046] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1170 gene, herein designated VGAM GENE, on one or more VGAM1170 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42047] It is yet further appreciated that a function of VGAM1170 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1170 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM1170 correlate with, and may be deduced from, the identity of the host target genes which VGAM1170 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42048] Nucleotide sequences of the VGAM1170 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1170 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1170 are further described hereinbelow with reference to Table 1.

[42049] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1170 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1170 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42050] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1170 gene, herein designated VGAM is inhibition of expression of VGAM1170 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1170 correlate with, and may be deduced from, the identity of the target genes which VGAM1170 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42051] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_033173) is a VGAM1170 host target gene. B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE5, designated SEQ ID:27037, SEQ ID:12699, SEQ ID:27022, SEQ ID:27027 and SEQ ID:27032 respectively, to the nucleotide sequence of VGAM1170 RNA, herein designated VGAM RNA, also designated SEQ ID:3881.

[42052] A function of VGAM1170 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_033173). Accordingly, utilities of VGAM1170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT5. DKFZP434L187 (Accession XM_044070) is another VGAM1170 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34118, to the nucleotide sequence of VGAM1170 RNA, herein designated VGAM RNA, also designated SEQ ID:3881.

[42053] Another function of VGAM1170 is therefore inhibition of

DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM1170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. NCUBE1 (Accession NM_016021) is another VGAM1170 host target gene. NCUBE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCUBE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCUBE1 BINDING SITE, designated SEQ ID:18092, to the nucleotide sequence of VGAM1170 RNA, herein designated VGAM RNA, also designated SEQ ID:3881.

[42054] Another function of VGAM1170 is therefore inhibition of NCUBE1 (Accession NM_016021). Accordingly, utilities of VGAM1170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCUBE1. LOC145773 (Accession XM_085237) is another VGAM1170 host target gene. LOC145773 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC145773 BINDING SITE, designated SEQ ID:37983, to the nucleotide sequence of VGAM1170 RNA, herein designated VGAM RNA, also designated SEQ ID:3881.

[42055] Another function of VGAM1170 is therefore inhibition of LOC145773 (Accession XM_085237). Accordingly, utilities of VGAM1170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145773. LOC145899 (Accession XM_096899) is another VGAM1170 host target gene. LOC145899 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145899 BINDING SITE, designated SEQ ID:40623, to the nucleotide sequence of VGAM1170 RNA, herein designated VGAM RNA, also designated SEQ ID:3881.

[42056] Another function of VGAM1170 is therefore inhibition of LOC145899 (Accession XM_096899). Accordingly, utilities of VGAM1170 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145899. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1171 (VGAM1171) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42057] VGAM1171 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1171 was detected is described hereinabove with reference to Figs. 1–8.

[42058] VGAM1171 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Fruit Mottle Mosaic Virus. VGAM1171 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42059] VGAM1171 gene encodes a VGAM1171 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1171 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1171 precursor RNA is designated SEQ ID:1157, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1157 is located at position 4341 relative to the genome of Cucumber Fruit Mottle Mosaic Virus.

[42060] VGAM1171 precursor RNA folds onto itself, forming VGAM1171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42061] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1171 folded precursor RNA into VGAM1171 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1171 RNA is designated SEQ ID:3882, and is provided hereinbelow with reference to the sequence listing part.

[42062] VGAM1171 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1171 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42063] VGAM1171 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1171 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1171 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1171 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[42064] The complementary binding of VGAM1171 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1171 host target RNA into VGAM1171 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42065] It is appreciated that VGAM1171 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1171 host target genes. The mRNA of each one of this plurality of VGAM1171 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1171 RNA, herein designated VGAM RNA, and which when bound by VGAM1171 RNA causes inhibition of translation of respective one or more

VGAM1171 host target proteins.

[42066] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1171 gene, herein designated VGAM GENE, on one or more VGAM1171 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42067] It is yet further appreciated that a function of VGAM1171 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of viral infection by Cucumber Fruit Mottle Mo-

saic Virus. Specific functions, and accordingly utilities, of VGAM1171 correlate with, and may be deduced from, the identity of the host target genes which VGAM1171 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42068] Nucleotide sequences of the VGAM1171 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1171 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1171 are further described hereinbelow with reference to Table 1.

[42069] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1171 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1171 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42070] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1171 gene, herein designated VGAM is inhibition of expression of VGAM1171 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1171 correlate with, and may be deduced from, the identity of the target genes which VGAM1171 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42071] AXL Receptor Tyrosine Kinase (AXL, Accession NM_001699) is a VGAM1171 host target gene. AXL BINDING SITE1 and AXL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE1 and AXL BINDING SITE2, designated SEQ ID:7418 and SEQ ID:22439 respectively, to the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, also designated SEQ ID:3882.

[42072] A function of VGAM1171 is therefore inhibition of AXL Receptor Tyrosine Kinase (AXL, Accession NM_001699). Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL. Regulator of G-protein Signalling 5 (RGS5, Accession NM_003617) is another VGAM1171 host target gene. RGS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by RGS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS5 BINDING SITE, designated SEQ ID:9677, to the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, also designated SEQ ID:3882.

[42073] Another function of VGAM1171 is therefore inhibition of Regulator of G-protein Signalling 5 (RGS5, Accession NM_003617). Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS5. KIAA0298 (Accession XM_084529) is another VGAM1171 host target gene. KIAA0298 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0298 BINDING SITE, designated SEQ ID:37624, to the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, also designated SEQ ID:3882.

[42074] Another function of VGAM1171 is therefore inhibition of

KIAA0298 (Accession XM_084529). Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0298. KIAA1229 (Accession XM_030665) is another VGAM1171 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1229 BINDING SITE, designated SEQ ID:31094, to the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, also designated SEQ ID:3882.

[42075] Another function of VGAM1171 is therefore inhibition of KIAA1229 (Accession XM_030665). Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. LOC129607 (Accession XM_059368) is another VGAM1171 host target gene. LOC129607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC129607 BINDING SITE, designated SEQ ID:36972, to the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, also designated SEQ ID:3882.

[42076] Another function of VGAM1171 is therefore inhibition of LOC129607 (Accession XM_059368). Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129607. LOC130639 (Accession XM_059464) is another VGAM1171 host target gene. LOC130639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC130639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130639 BINDING SITE, designated SEQ ID:37001, to the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, also designated SEQ ID:3882.

[42077] Another function of VGAM1171 is therefore inhibition of LOC130639 (Accession XM_059464). Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130639. LOC200339 (Accession XM_117226) is an-

other VGAM1171 host target gene. LOC200339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE, designated SEQ ID:43297, to the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, also designated SEQ ID:3882.

[42078] Another function of VGAM1171 is therefore inhibition of LOC200339 (Accession XM_117226). Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. LOC257465 (Accession XM_088384) is another VGAM1171 host target gene. LOC257465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257465 BINDING SITE, designated SEQ ID:39664, to the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, also designated SEQ ID:3882.

[42079] Another function of VGAM1171 is therefore inhibition of LOC257465 (Accession XM_088384). Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257465. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1172 (VGAM1172) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42080] VGAM1172 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1172 was detected is described hereinabove with reference to Figs. 1–8.

[42081] VGAM1172 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Fruit Mottle Mosaic Virus. VGAM1172 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42082] VGAM1172 gene encodes a VGAM1172 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1172 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1172 precursor RNA is designated SEQ ID:1158, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1158 is located at position 5778 relative to the genome of Cucumber Fruit Mottle Mosaic Virus.

[42083] VGAM1172 precursor RNA folds onto itself, forming VGAM1172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42084] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1172 folded precursor RNA into VGAM1172 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1172 RNA is designated SEQ ID:3883, and is provided hereinbelow with reference to the sequence listing part.

[42085] VGAM1172 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1172 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[42086] VGAM1172 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1172 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1172 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42087] The complementary binding of VGAM1172 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1172 host target RNA into VGAM1172 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42088] It is appreciated that VGAM1172 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1172 host target genes. The mRNA of each one of this plurality of VGAM1172 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1172 RNA, herein designated VGAM RNA, and which when bound by VGAM1172 RNA causes inhibition of translation of respective one or more VGAM1172 host target proteins.

[42089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1172 gene, herein designated VGAM GENE, on one or more VGAM1172 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42090] It is yet further appreciated that a function of VGAM1172 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of viral infection by Cucumber Fruit Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1172 correlate with, and may be deduced from, the identity of the host target genes which VGAM1172 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42091] Nucleotide sequences of the VGAM1172 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1172 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1172 are further described hereinbelow with reference to Table 1.

[42092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1172 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1172 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[42093] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1172 gene, herein designated VGAM is inhibition of expression of VGAM1172 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1172 correlate with, and may be deduced from, the identity of the target genes which VGAM1172 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42094] F-box and Leucine-rich Repeat Protein 3A (FBXL3A, Accession NM_012158) is a VGAM1172 host target gene. FBXL3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL3A BINDING SITE, designated SEQ ID:14456, to the nucleotide sequence of VGAM1172 RNA, herein designated VGAM RNA, also designated SEQ ID:3883.

[42095] A function of VGAM1172 is therefore inhibition of F-box and Leucine-rich Repeat Protein 3A (FBXL3A, Accession NM_012158), a gene which is a putative SCF ubiquitin lig-

ase subunit involved in protein degradation. Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL3A. The function of FBXL3A has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40–amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F–box proteins are components of modular E3 ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134, F–box proteins), which function in phosphorylation–dependent ubiquitination. Using a yeast 2–hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F–box proteins, respectively. These contained C termini with leucine–rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). By Northern blot analysis, Cenciarelli et al. (1999) found ubiquitous expression of an approximately 4.4–kb FBXL3A transcript. Immunofluorescence microscopy demonstrated nuclear localization for both wildtype FBXL3A and mutant FBXL3A lacking the F box.

[42096] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42097] Cenciarelli, C.; Chiaur, D. S.; Guardavaccaro, D.; Parks, W.; Vidal, M.; Pagano, M. : Identification of a family of human F-box proteins. Curr. Biol. 9: 1177–1179, 1999. ; and

[42098] Chiaur, D. S.; Murthy, S.; Cenciarelli, C.; Parks, W.; Loda, M.; Inghirami, G.; Demetrick, D.; Pagano, M. : Five human genes encoding F-box proteins: chromosome mapping and analysis in.

[42099] Further studies establishing the function and utilities of FBXL3A are found in John Hopkins OMIM database record ID 605653, and in cited publications numbered 40 and 416 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424) is another VGAM1172 host target gene. CECR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CECR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE, designated SEQ

ID:18881, to the nucleotide sequence of VGAM1172 RNA, herein designated VGAM RNA, also designated SEQ ID:3883.

[42100] Another function of VGAM1172 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424). Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1. Cortactin Binding Protein 2 (CORTBP2, Accession NM_033427) is another VGAM1172 host target gene. CORTBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CORTBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORTBP2 BINDING SITE, designated SEQ ID:27250, to the nucleotide sequence of VGAM1172 RNA, herein designated VGAM RNA, also designated SEQ ID:3883.

[42101] Another function of VGAM1172 is therefore inhibition of Cortactin Binding Protein 2 (CORTBP2, Accession NM_033427). Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CORTBP2. KIAA1900 (Accession XM_055299) is another VGAM1172 host target gene. KIAA1900 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1900 BINDING SITE, designated SEQ ID:36257, to the nucleotide sequence of VGAM1172 RNA, herein designated VGAM RNA, also designated SEQ ID:3883.

[42102] Another function of VGAM1172 is therefore inhibition of KIAA1900 (Accession XM_055299). Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1900. Makorin, Ring Finger Protein, 2 (MKRN2, Accession XM_051580) is another VGAM1172 host target gene. MKRN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKRN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN2 BINDING SITE, designated SEQ

ID:35856, to the nucleotide sequence of VGAM1172 RNA, herein designated VGAM RNA, also designated SEQ ID:3883.

[42103] Another function of VGAM1172 is therefore inhibition of Makorin, Ring Finger Protein, 2 (MKRN2, Accession XM_051580). Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN2. LOC144182 (Accession NM_139136) is another VGAM1172 host target gene. LOC144182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144182 BINDING SITE, designated SEQ ID:29168, to the nucleotide sequence of VGAM1172 RNA, herein designated VGAM RNA, also designated SEQ ID:3883.

[42104] Another function of VGAM1172 is therefore inhibition of LOC144182 (Accession NM_139136). Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144182. LOC151878 (Accession XM_087329) is an-

other VGAM1172 host target gene. LOC151878 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151878 BINDING SITE, designated SEQ ID:39171, to the nucleotide sequence of VGAM1172 RNA, herein designated VGAM RNA, also designated SEQ ID:3883.

[42105] Another function of VGAM1172 is therefore inhibition of LOC151878 (Accession XM_087329). Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151878. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1173 (VGAM1173) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42106] VGAM1173 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1173 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[42107] VGAM1173 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Fruit Mottle Mosaic Virus. VGAM1173 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42108] VGAM1173 gene encodes a VGAM1173 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1173 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1173 precursor RNA is designated SEQ ID:1159, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1159 is located at position 5471 relative to the genome of Cucumber Fruit Mottle Mosaic Virus.

[42109] VGAM1173 precursor RNA folds onto itself, forming VGAM1173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42110] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1173 folded precursor RNA into VGAM1173 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1173 RNA is designated SEQ ID:3884, and is provided hereinbelow with reference to the sequence listing part.

[42111] VGAM1173 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1173 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42112] VGAM1173 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1173 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1173 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42113] The complementary binding of VGAM1173 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1173 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1173 host target RNA into VGAM1173 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42114] It is appreciated that VGAM1173 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1173 host target genes. The mRNA of each one of this plurality of VGAM1173 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1173 RNA, herein designated VGAM RNA, and which when bound by VGAM1173 RNA causes inhibition of translation of respective one or more VGAM1173 host target proteins.

[42115] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1173 gene, herein designated VGAM GENE, on one or more VGAM1173 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42116] It is yet further appreciated that a function of VGAM1173 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of viral infection by Cucumber Fruit Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1173 correlate with, and may be deduced from, the identity of the host target genes which VGAM1173 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42117] Nucleotide sequences of the VGAM1173 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1173 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1173 are further described hereinbelow with reference to Table 1.

[42118] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1173 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1173 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42119] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1173 gene, herein designated VGAM is inhibition of expression of VGAM1173 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1173 correlate with, and may be deduced from, the identity of the target genes which VGAM1173 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42120] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 13 (ADAMTS13, Accession NM_139025) is a VGAM1173 host target gene. ADAMTS13 BINDING SITE1 through ADAMTS13 BINDING SITE3 are HOST TARGET binding sites found in untrans-

lated regions of mRNA encoded by ADAMTS13, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS13 BINDING SITE1 through ADAMTS13 BINDING SITE3, designated SEQ ID:29125, SEQ ID:29127 and SEQ ID:29131 respectively, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42121] A function of VGAM1173 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 13 (ADAMTS13, Accession NM_139025), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS13. The function of ADAMTS13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131.CCAAT/enhancer Binding Protein (C/EBP), Alpha (CEBPA, Accession NM_004364) is another VGAM1173 host target gene. CEBPA BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by CEBPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEBPA BINDING SITE, designated SEQ ID:10573, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42122] Another function of VGAM1173 is therefore inhibition of CCAAT/enhancer Binding Protein (C/EBP), Alpha (CEBPA, Accession NM_004364). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEBPA. Heat Shock 70kDa Protein 4 (HSPA4, Accession XM_114482) is another VGAM1173 host target gene. HSPA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA4 BINDING SITE, designated SEQ ID:42977, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ

ID:3884.

[42123] Another function of VGAM1173 is therefore inhibition of Heat Shock 70kDa Protein 4 (HSPA4, Accession XM_114482). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA4. Heat Shock 60kDa Protein 1 (chaperonin) (HSPD1, Accession XM_012182) is another VGAM1173 host target gene. HSPD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPD1 BINDING SITE, designated SEQ ID:30208, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42124] Another function of VGAM1173 is therefore inhibition of Heat Shock 60kDa Protein 1 (chaperonin) (HSPD1, Accession XM_012182), a gene which is implicated in mitochondrial protein import and macromolecular assembly. may facilitate the correct folding of imported proteins. may also prevent misfolding and promote the refolding and proper assembly of unfolded polypeptides generated

under stress conditions in the mitochondrial matrix. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPD1. The function of HSPD1 has been established by previous studies. Hereditary spastic paraplegia (HSP) represents a clinically and genetically heterogeneous group of neurodegenerative disorders that are characterized by progressive spasticity and weakness of the lower limbs. Seventeen different loci had been mapped, and the corresponding genes for 5 of these had been cloned and identified. Two of the 5 gene products--paraplegin (SPG7; 602783) and spastin (SPG4; 182601)--feature AAA+ domains and are predicted to possess chaperone activity. Paraplegin is the human homolog of a yeast protease/chaperone that is involved in mitochondrial protein quality control. The HSP60 gene maps to the same region, namely 2q33.1, as does spastic paraplegia-13 (SPG13; 605280), as determined by Fontaine et al. (2000). Speculating that the mitochondrial chaperonin HSP60 or its co-chaperonin HSP10 (OMIM Ref. No. 600141), which maps to the same region, might be the site of mutation(s) causing SPG13, Hansen et al. (2002) sequenced HSP60 in 2 affected members of the

family with SPG13. They found that both were heterozygous for a G-to-A variation at position 292 of the HSP60 cDNA, resulting in the substitution of a valine at position 72 in the mature HSP60 by isoleucine (V72I). Studies in *E. coli* indicated that the V72I mutant protein is functionally incapacitated. The authors suggested that SPG4, SPG7, and SPG13 can be referred to as chaperonopathies. Azem et al. (1994) performed chemical cross-linking and electron microscopy studies on bacterial chaperonins GroEL and GroES to determine how they interact with unfolded proteins. GroEL is an oligomer of 14 identical 57.3-kD subunits, with a structure of 2 stacked heptameric rings arranged around a 2-fold axis of symmetry (Saibil et al., 1991). It appears as a hollow cylinder. In the presence of ATP, 2 GroES (see OMIM Ref. No. 600141) rings (each made of 7 identical 10.4-kD subunits) can successively bind a single GroEL core to make a functional symmetric heterodimer. Although the central core of GroEL is obstructed by the 2 GroES rings at each end, this heterodimer can stably bind and assist the refolding of the RuBisCo enzyme. While binding was thought to occur in the central cavity, these data indicate that unfolded proteins may bind and fold on the external envelope of some

chaperonins (Azem et al., 1994). Schmidt et al. (1994) suggested that the symmetric chaperonin complex is functionally significant because complete folding of a nonnative substrate protein in the presence of GroEL and GroES occurs only in the presence of ATP, and not with ADP. Chaperonin-assisted folding occurs by a catalytic cycle in which one ATP is hydrolyzed by one ring of GroEL in a quantized manner with each turnover. Todd et al. (1994) proposed a unifying model for chaperonin-facilitated protein folding based on successive rounds of binding and release, and partitioning between committed and kinetically trapped intermediates.

[42125] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42126] Fontaine, B.; Davoine, C.-S.; Durr, A.; Paternotte, C.; Feki, I.; Weissenbach, J.; Hazan, J.; Brice, A. : A new locus for autosomal dominant pure spastic paraplegia, on chromosome 2q24-q34. *Am. J. Hum. Genet.* 66: 702-707, 2000. ; and

[42127] Hansen, J. J.; Durr, A.; Cournu-Rebeix, I.; Georgopoulos, C.; Ang, D.; Nielsen, M. N.; Davoine, C.-S.; Brice, A.; Fontaine, B.; Gregersen, N.; Bross, P. : Hereditary spastic

paraplegia SPG.

[42128] Further studies establishing the function and utilities of HSPD1 are found in John Hopkins OMIM database record ID 118190, and in cited publications numbered 840–843, 10688–84 and 10689 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679) is another VGAM1173 host target gene. KMO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KMO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KMO BINDING SITE, designated SEQ ID:9783, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42129] Another function of VGAM1173 is therefore inhibition of Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM_003679), a gene which may play a role in encephalic photoreception. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with KMO. The function of KMO and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM162. Nuclear Receptor Subfamily 3, Group C, Member 2 (NR3C2, Accession NM_000901) is another VGAM1173 host target gene. NR3C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR3C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR3C2 BINDING SITE, designated SEQ ID:6599, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42130] Another function of VGAM1173 is therefore inhibition of Nuclear Receptor Subfamily 3, Group C, Member 2 (NR3C2, Accession NM_000901), a gene which is to increase ion and water transport and thus raise extracellular fluid volume and blood pressure and lower potassium levels. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C2. The function of NR3C2 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM186. Origin Recognition Complex, Subunit 2-like (yeast) (ORC2L, Accession NM_006190) is another VGAM1173 host target gene. ORC2L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ORC2L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORC2L BINDING SITE, designated SEQ ID:12864, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42131] Another function of VGAM1173 is therefore inhibition of Origin Recognition Complex, Subunit 2-like (yeast) (ORC2L, Accession NM_006190), a gene which is a subunit of the origin recognition complex and may be required for initiation of DNA replication. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORC2L. The function of ORC2L has been established by previous studies. The origin recognition complex (ORC) is a multi-

protein assemblage identified in *S. cerevisiae* that binds to the ARS (autonomously replicating sequence) consensus, a DNA motif that is an essential part of yeast origins of replication. ORC binding has also been implicated in transcriptional silencing at certain yeast loci. One component of the ORC is a 72-kD protein designated ORC2, mutations of which disrupt silencing at the HMR-E silencer and cause cell cycle arrest between late G1 and the initiation of DNA replication. Takahara et al. (1996) isolated a cDNA from a mouse embryonic stem cell library and a human placenta library whose predicted 577-amino acid protein resembles the yeast sequence. The mouse and human sequences of the ORC2L (ORC2-like) proteins are 47.9% and 46.3% similar to yeast ORC2, respectively. Northern blots showed highest levels of ORC2L expression in testes. Dhar et al. (2001) used homologous recombination to replace the third exon encoding the initiator ATG of the ORC2 gene with a neomycin phosphotransferase gene in a colon carcinoma cell line. This hypomorphic mutation decreased ORC2 protein levels by 90%. The G1 phase of the cell cycle was prolonged, but there was no effect on the utilization of either the MYC (OMIM Ref. No. 190080) or beta-globin (OMIM Ref. No. 141900) cellular origins of replication.

Cells carrying the ORC2 mutation failed to support the replication of a plasmid bearing the oriP replicator of Epstein-Barr virus (EBV), and this defect could be rescued by reintroduction of ORC2. ORC2 specifically associated with oriP in cells, most likely through its interaction with EBV nuclear antigen-1. Geminin (OMIM Ref. No. 602842), an inhibitor of the mammalian replication initiation complex, inhibited replication from oriP. Therefore, ORC and the human replication initiation apparatus is required for replication from a viral origin of replication.

[42132] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42133] Dhar, S. K.; Yoshida, K.; Machida, Y.; Khaira, P.; Chaudhuri, B.; Wohlschlegel, J. A.; Leffak, M.; Yates, J.; Dutta, A. : Replication from oriP of Epstein-Barr virus requires human ORC and is inhibited by geminin. Cell 106: 287-296, 2001. ; and

[42134] Takahara, K.; Bong, M.; Brevard, R.; Eddy, R. L.; Haley, L. L.; Sait, S. J.; Shows, T. B.; Hoffman, G. G.; Greenspan, D. S. : Mouse and human homologues of the yeast origin of replica.

[42135] Further studies establishing the function and utilities of

ORC2L are found in John Hopkins OMIM database record ID 601182, and in cited publications numbered 9505–9508 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PACE (Accession NM_002569) is another VGAM1173 host target gene. PACE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE BINDING SITE, designated SEQ ID:8428, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42136] Another function of VGAM1173 is therefore inhibition of PACE (Accession NM_002569), a gene which processes pro-parathyroid hormone, pro-transforming growth factor beta. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE. The function of PACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM151. Protocadherin 11 X-linked (PCDH11X, Acces-

sion NM_032968) is another VGAM1173 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26796 and SEQ ID:26811 respectively, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42137] Another function of VGAM1173 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433. Protein Phosphatase 1, Regulatory (inhibitor)

Subunit 11 (PPP1R11, Accession NM_021959) is another VGAM1173 host target gene. PPP1R11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R11 BINDING SITE, designated SEQ ID:22485, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42138] Another function of VGAM1173 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 11 (PPP1R11, Accession NM_021959), a gene which inhibits rabbit muscle protein phosphatase-1 in vitro . Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R11. The function of PPP1R11 has been established by previous studies. Using a cDNA selection technique to identify genes in the hemochromatosis (OMIM Ref. No. 235200) gene region on 6p21.3, El Kahloun et al. (1993) cloned PPP1R11, which they called HCGV (hemochromatosis candidate gene V). By screening cDNA libraries and using PCR techniques, Giffon et al.

(1996) obtained a full-length cDNA encoding PPP1R11. The predicted 126-amino acid PPP1R11 protein contains 8 potential phosphorylation sites and a C-terminal PEST pattern that is characteristic of proteins with short half-lives. PPP1R11 shares 89.7% amino acid identity with its mouse homolog, Tctex5. Northern blot analysis detected a 1.8-kb PPP1R11 transcript in all fetal and adult tissues tested. The PPP1R11 gene appeared to be widely preserved throughout animal evolution, and Giffon et al. (1996) detected fragments on the DNAs of primates, rat, dog, cow, and rabbit. By screening sequence databases, Lepourcelet et al. (1996) identified a cDNA clone that suggested the existence of at least 1 spliced isoform of PPP1R11. Using a yeast 2-hybrid screen to identify putative protein phosphatase-1 (PP1; OMIM Ref. No. 176875)-binding proteins, Zhang et al. (1998) obtained a cDNA encoding PPP1R11, which they called inhibitor-3. They reported that PPP1R11 is hydrophilic, heat stable, and behaves anomalously on SDS-PAGE, with an apparent molecular mass of 23 kD compared with its calculated molecular mass of 14 kD, and on gel filtration, with a relative molecular weight of 55,000. Zhang et al. (1998) showed that PPP1R11 is a specific inhibitor of PP1 with a

differential sensitivity toward the metal-independent and metal-dependent forms of PP1. They hypothesized that the PP1-binding ability of PPP1R11 is due at least in part to the possession of a VxW motif. PPP1R11 is well conserved in evolution, with related genes in *S. cerevisiae*, *S. pombe*, and *C. elegans*.

[42139] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42140] Lepourcelet, M.; Andrieux, N.; Giffon, T.; Pichon, L.; Hampe, A.; Galibert, F.; Mosser, J. : Systematic sequencing of the human HLA-A/HLA-F region: establishment of a cosmid contig and identification of a new gene cluster within 37 kb of sequence. *Genomics* 37: 316-326, 1996. ; and

[42141] Zhang, J.; Zhang, L.; Zhao, S.; Lee, E. Y. C. : Identification and characterization of the human HCG V gene product as a novel inhibitor of protein phosphatase-1. *Biochemistry* 37: 16728.

[42142] Further studies establishing the function and utilities of PPP1R11 are found in John Hopkins OMIM database record ID 606670, and in cited publications numbered 910 and 9568-6456 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Ubiquitin-conjugating Enzyme E2G 2 (UBC7 homolog, yeast) (UBE2G2, Accession XM_036087) is another VGAM1173 host target gene. UBE2G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2G2 BINDING SITE, designated SEQ ID:32378, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42143] Another function of VGAM1173 is therefore inhibition of Ubiquitin-conjugating Enzyme E2G 2 (UBC7 homolog, yeast) (UBE2G2, Accession XM_036087), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2G2. The function of UBE2G2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM164. Angiotensin II Receptor-like 2 (AGTRL2, Acces-

sion NM_005162) is another VGAM1173 host target gene. AGTRL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AGTRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGTRL2 BINDING SITE, designated SEQ ID:11648, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42144] Another function of VGAM1173 is therefore inhibition of Angiotensin II Receptor-like 2 (AGTRL2, Accession NM_005162). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGTRL2. ARP3BETA (Accession NM_020445) is another VGAM1173 host target gene. ARP3BETA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARP3BETA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARP3BETA BINDING SITE, designated SEQ ID:21687, to the nucleotide sequence of VGAM1173

RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42145] Another function of VGAM1173 is therefore inhibition of ARP3BETA (Accession NM_020445). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARP3BETA. DCOHM (Accession NM_032151) is another VGAM1173 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25852, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42146] Another function of VGAM1173 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. DKFZp566H0824 (Accession NM_017535) is another VGAM1173 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:18981, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42147] Another function of VGAM1173 is therefore inhibition of DKFZp566H0824 (Accession NM_017535). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. EFA6R (Accession NM_015310) is another VGAM1173 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17628, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42148] Another function of VGAM1173 is therefore inhibition of

EFA6R (Accession NM_015310). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. Epiregulin (EREG, Accession NM_001432) is another VGAM1173 host target gene. EREG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EREG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EREG BINDING SITE, designated SEQ ID:7158, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42149] Another function of VGAM1173 is therefore inhibition of Epiregulin (EREG, Accession NM_001432). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EREG. FLJ10656 (Accession NM_018170) is another VGAM1173 host target gene. FLJ10656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10656 BINDING SITE, designated SEQ ID:19992, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42150] Another function of VGAM1173 is therefore inhibition of FLJ10656 (Accession NM_018170). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10656. FLJ10891 (Accession NM_018260) is another VGAM1173 host target gene. FLJ10891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10891 BINDING SITE, designated SEQ ID:20227, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42151] Another function of VGAM1173 is therefore inhibition of FLJ10891 (Accession NM_018260). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10891. FLJ21106 (Accession NM_025097) is another

VGAM1173 host target gene. FLJ21106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21106 BINDING SITE, designated SEQ ID:24739, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42152] Another function of VGAM1173 is therefore inhibition of FLJ21106 (Accession NM_025097). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21106. FLJ23511 (Accession NM_032239) is another VGAM1173 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25970, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42153] Another function of VGAM1173 is therefore inhibition of FLJ23511 (Accession NM_032239). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. KIAA0152 (Accession NM_014730) is another VGAM1173 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16343, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42154] Another function of VGAM1173 is therefore inhibition of KIAA0152 (Accession NM_014730). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. KIAA0940 (Accession NM_014912) is another VGAM1173 host target gene. KIAA0940 BINDING SITE1 and KIAA0940 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0940, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0940 BINDING SITE1 and KIAA0940 BINDING SITE2, designated SEQ ID:17150 and SEQ ID:17151 respectively, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42155] Another function of VGAM1173 is therefore inhibition of KIAA0940 (Accession NM_014912). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0940. Mitochondrial Ribosomal Protein S10 (MRPS10, Accession NM_018141) is another VGAM1173 host target gene. MRPS10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPS10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS10 BINDING SITE, designated SEQ ID:19941, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42156] Another function of VGAM1173 is therefore inhibition of

Mitochondrial Ribosomal Protein S10 (MRPS10, Accession NM_018141). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS10. SDS3 (Accession XM_045014) is another VGAM1173 host target gene. SDS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDS3 BINDING SITE, designated SEQ ID:34322, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42157] Another function of VGAM1173 is therefore inhibition of SDS3 (Accession XM_045014). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDS3. Serine/threonine Kinase 3 (STE20 homolog, yeast) (STK3, Accession XM_057232) is another VGAM1173 host target gene. STK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of STK3 BINDING SITE, designated SEQ ID:36495, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42158] Another function of VGAM1173 is therefore inhibition of Serine/threonine Kinase 3 (STE20 homolog, yeast) (STK3, Accession XM_057232). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK3. TUCAN (Accession NM_014959) is another VGAM1173 host target gene. TUCAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUCAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUCAN BINDING SITE, designated SEQ ID:17322, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42159] Another function of VGAM1173 is therefore inhibition of TUCAN (Accession NM_014959). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUCAN.

ZNF340 (Accession XM_097701) is another VGAM1173 host target gene. ZNF340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF340 BINDING SITE, designated SEQ ID:41036, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42160] Another function of VGAM1173 is therefore inhibition of ZNF340 (Accession XM_097701). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF340. LOC143785 (Accession XM_084635) is another VGAM1173 host target gene. LOC143785 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143785, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143785 BINDING SITE, designated SEQ ID:37633, to the nucleotide sequence of VGAM1173 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3884.

[42161] Another function of VGAM1173 is therefore inhibition of LOC143785 (Accession XM_084635). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143785. LOC144453 (Accession XM_084869) is another VGAM1173 host target gene. LOC144453 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144453 BINDING SITE, designated SEQ ID:37749, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42162] Another function of VGAM1173 is therefore inhibition of LOC144453 (Accession XM_084869). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144453. LOC148824 (Accession XM_097527) is another VGAM1173 host target gene. LOC148824 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148824, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148824 BINDING SITE, designated SEQ ID:40910, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42163] Another function of VGAM1173 is therefore inhibition of LOC148824 (Accession XM_097527). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148824. LOC200471 (Accession XM_117234) is another VGAM1173 host target gene. LOC200471 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200471 BINDING SITE, designated SEQ ID:43305, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42164] Another function of VGAM1173 is therefore inhibition of LOC200471 (Accession XM_117234). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC200471. LOC201696 (Accession XM_032269) is another VGAM1173 host target gene. LOC201696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:31628, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42165] Another function of VGAM1173 is therefore inhibition of LOC201696 (Accession XM_032269). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. LOC257465 (Accession XM_088384) is another VGAM1173 host target gene. LOC257465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257465 BINDING SITE, designated SEQ ID:39668, to

the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42166] Another function of VGAM1173 is therefore inhibition of LOC257465 (Accession XM_088384). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257465. LOC91408 (Accession XM_038290) is another VGAM1173 host target gene. LOC91408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91408 BINDING SITE, designated SEQ ID:32794, to the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, also designated SEQ ID:3884.

[42167] Another function of VGAM1173 is therefore inhibition of LOC91408 (Accession XM_038290). Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1174 (VGAM1174) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42168] VGAM1174 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1174 was detected is described hereinabove with reference to Figs. 1–8.

[42169] VGAM1174 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rift Valley Fever Virus. VGAM1174 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42170] VGAM1174 gene encodes a VGAM1174 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1174 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1174 precursor RNA is designated SEQ ID:1160, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1160 is located at position 4915 relative to the genome of Rift Valley Fever Virus.

[42171] VGAM1174 precursor RNA folds onto itself, forming VGAM1174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42172] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1174 folded precursor RNA into VGAM1174 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1174 RNA is designated SEQ ID:3885, and is provided hereinbelow with reference to the sequence listing part.

[42173] VGAM1174 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1174 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1174 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42174] VGAM1174 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1174 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1174 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42175] The complementary binding of VGAM1174 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1174 host target RNA into VGAM1174 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42176] It is appreciated that VGAM1174 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1174 host target genes. The mRNA of each one of this plurality of VGAM1174 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1174 RNA, herein designated VGAM RNA, and which when bound by VGAM1174 RNA causes inhibition of translation of respective one or more VGAM1174 host target proteins.

[42177] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1174 gene, herein designated VGAM GENE, on one or more VGAM1174 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42178] It is yet further appreciated that a function of VGAM1174 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1174 include diagnosis, prevention and treatment of viral infection by Rift Valley Fever Virus. Specific functions, and accordingly utilities, of VGAM1174 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1174 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42179] Nucleotide sequences of the VGAM1174 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1174 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1174 are further described hereinbelow with reference to Table 1.

[42180] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1174 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1174 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42181] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1174 gene, herein designated VGAM is inhibition of expression of VGAM1174 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1174 correlate with, and may be deduced from, the identity of the target genes which VGAM1174

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42182] LHPP (Accession NM_022126) is a VGAM1174 host target gene. LHPP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHPP BINDING SITE, designated SEQ ID:22674, to the nucleotide sequence of VGAM1174 RNA, herein designated VGAM RNA, also designated SEQ ID:3885.

[42183] A function of VGAM1174 is therefore inhibition of LHPP (Accession NM_022126). Accordingly, utilities of VGAM1174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHPP. LOC151584 (Accession XM_098089) is another VGAM1174 host target gene. LOC151584 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151584 BINDING SITE, designated SEQ ID:41376, to

the nucleotide sequence of VGAM1174 RNA, herein designated VGAM RNA, also designated SEQ ID:3885.

[42184] Another function of VGAM1174 is therefore inhibition of LOC151584 (Accession XM_098089). Accordingly, utilities of VGAM1174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151584. LOC201799 (Accession XM_114380) is another VGAM1174 host target gene. LOC201799 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201799 BINDING SITE, designated SEQ ID:42914, to the nucleotide sequence of VGAM1174 RNA, herein designated VGAM RNA, also designated SEQ ID:3885.

[42185] Another function of VGAM1174 is therefore inhibition of LOC201799 (Accession XM_114380). Accordingly, utilities of VGAM1174 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201799. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1175 (VGAM1175) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42186] VGAM1175 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1175 was detected is described hereinabove with reference to Figs. 1–8.

[42187] VGAM1175 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rift Valley Fever Virus. VGAM1175 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42188] VGAM1175 gene encodes a VGAM1175 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1175 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1175 precursor RNA is designated SEQ ID:1161, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1161 is located at position 5974 relative to the genome of Rift Valley Fever Virus.

[42189] VGAM1175 precursor RNA folds onto itself, forming VGAM1175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42190] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1175 folded precursor RNA into VGAM1175 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1175 RNA is designated SEQ ID:3886, and is provided hereinbelow with reference to the sequence listing part.

[42191] VGAM1175 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1175 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1175 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42192] VGAM1175 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1175 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1175 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1175 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1175 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42193] The complementary binding of VGAM1175 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1175 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1175 host target RNA into VGAM1175 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42194] It is appreciated that VGAM1175 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1175 host target genes. The mRNA of each one of this plurality of VGAM1175 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1175 RNA, herein designated VGAM RNA, and which when bound by VGAM1175 RNA causes inhibition of translation of respective one or more VGAM1175 host target proteins.

[42195] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1175 gene, herein designated VGAM GENE, on one or more VGAM1175 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42196] It is yet further appreciated that a function of VGAM1175 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of viral infection by Rift Valley Fever Virus. Specific functions, and accordingly utilities, of VGAM1175 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1175 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42197] Nucleotide sequences of the VGAM1175 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1175 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1175 are further described hereinbelow with reference to Table 1.

[42198] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1175 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1175 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42199] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1175 gene, herein designated VGAM is inhibition of expression of VGAM1175 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1175 correlate with, and may be deduced from, the identity of the target genes which VGAM1175

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42200] Lunatic Fringe Homolog (Drosophila) (LFNG, Accession XM_166539) is a VGAM1175 host target gene. LFNG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFNG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFNG BINDING SITE, designated SEQ ID:44510, to the nucleotide sequence of VGAM1175 RNA, herein designated VGAM RNA, also designated SEQ ID:3886.

[42201] A function of VGAM1175 is therefore inhibition of Lunatic Fringe Homolog (Drosophila) (LFNG, Accession XM_166539). Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFNG. MGC3178 (Accession NM_030810) is another VGAM1175 host target gene. MGC3178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of MGC3178 BINDING SITE, designated SEQ ID:25132, to the nucleotide sequence of VGAM1175 RNA, herein designated VGAM RNA, also designated SEQ ID:3886.

[42202] Another function of VGAM1175 is therefore inhibition of MGC3178 (Accession NM_030810). Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3178. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM1175 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45772, to the nucleotide sequence of VGAM1175 RNA, herein designated VGAM RNA, also designated SEQ ID:3886.

[42203] Another function of VGAM1175 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. LOC145501 (Accession

XM_085157) is another VGAM1175 host target gene.

LOC145501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145501 BINDING SITE, designated SEQ ID:37883, to the nucleotide sequence of VGAM1175 RNA, herein designated VGAM RNA, also designated SEQ ID:3886.

[42204] Another function of VGAM1175 is therefore inhibition of LOC145501 (Accession XM_085157). Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145501. LOC147671 (Accession XM_085844) is another VGAM1175 host target gene. LOC147671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147671 BINDING SITE, designated SEQ ID:38379, to the nucleotide sequence of VGAM1175 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3886.

[42205] Another function of VGAM1175 is therefore inhibition of LOC147671 (Accession XM_085844). Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147671. LOC157273 (Accession XM_098743) is another VGAM1175 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41788, to the nucleotide sequence of VGAM1175 RNA, herein designated VGAM RNA, also designated SEQ ID:3886.

[42206] Another function of VGAM1175 is therefore inhibition of LOC157273 (Accession XM_098743). Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. LOC91380 (Accession XM_038134) is another VGAM1175 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91380, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:32759, to the nucleotide sequence of VGAM1175 RNA, herein designated VGAM RNA, also designated SEQ ID:3886.

[42207] Another function of VGAM1175 is therefore inhibition of LOC91380 (Accession XM_038134). Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1176 (VGAM1176) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42208] VGAM1176 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1176 was detected is described hereinabove with reference to Figs. 1-8.

[42209] VGAM1176 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rift Valley Fever Virus.

VGAM1176 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42210] VGAM1176 gene encodes a VGAM1176 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1176 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1176 precursor RNA is designated SEQ ID:1162, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1162 is located at position 2112 relative to the genome of Rift Valley Fever Virus.

[42211] VGAM1176 precursor RNA folds onto itself, forming VGAM1176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42212] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1176 folded precursor RNA into VGAM1176 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1176 RNA is designated SEQ ID:3887, and is provided hereinbelow with reference to the sequence listing part.

[42213] VGAM1176 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1176 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42214] VGAM1176 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1176 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1176 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42215] The complementary binding of VGAM1176 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1176 host target RNA into VGAM1176 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42216] It is appreciated that VGAM1176 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1176 host target genes. The mRNA of each one of this plurality of VGAM1176 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1176 RNA, herein designated VGAM RNA, and which when bound by VGAM1176 RNA causes inhibition of translation of respective one or more VGAM1176 host target proteins.

[42217] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1176 gene, herein designated VGAM GENE, on one or more VGAM1176 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42218] It is yet further appreciated that a function of VGAM1176 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of viral infection by Rift Valley Fever Virus. Specific functions, and accordingly utilities, of VGAM1176 correlate with, and may be deduced from, the identity of the host target genes which VGAM1176 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42219] Nucleotide sequences of the VGAM1176 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1176 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1176 are further described hereinbelow with reference to Table 1.

[42220] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1176 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1176 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42221] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1176 gene, herein designated VGAM is inhibition of expression of VGAM1176 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1176 correlate with, and may be deduced from, the identity of the target genes which VGAM1176 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42222] Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282) is a VGAM1176 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ

ID:6955, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42223] A function of VGAM1176 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126. Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093) is another VGAM1176 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11552, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ

ID:3887.

[42224] Another function of VGAM1176 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Collagen, Type IV, Alpha 6 (COL4A6, Accession NM_033641) is another VGAM1176 host target gene. COL4A6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by COL4A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A6 BINDING SITE, designated SEQ ID:27360, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42225] Another function of VGAM1176 is therefore inhibition of Collagen, Type IV, Alpha 6 (COL4A6, Accession

NM_033641). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A6. EphB1 (EPHB1, Accession NM_004441) is another VGAM1176 host target gene. EPHB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB1 BINDING SITE, designated SEQ ID:10728, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42226] Another function of VGAM1176 is therefore inhibition of EphB1 (EPHB1, Accession NM_004441), a gene which receptor for members of the ephrin-b family. binds to ephrin-b1, -b2 and -b3. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB1. The function of EPHB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1000. Guanine Nucleotide Binding Protein (G pro-

tein), Beta Polypeptide 3 (GNB3, Accession NM_002075) is another VGAM1176 host target gene. GNB3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB3 BINDING SITE, designated SEQ ID:7854, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42227] Another function of VGAM1176 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 3 (GNB3, Accession NM_002075), a gene which transduces signals from G protein-coupled receptors to intracellular effectors. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB3. The function of GNB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Glypican 1 (GPC1, Accession NM_002081) is another VGAM1176 host target gene. GPC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by GPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC1 BINDING SITE, designated SEQ ID:7871, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42228] Another function of VGAM1176 is therefore inhibition of Glypican 1 (GPC1, Accession NM_002081), a gene which may play a role in growth control and differentiation. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC1. The function of GPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275) is another VGAM1176 host target gene. IL1F5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL1F5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BIND-

ING SITE, designated SEQ ID:14600, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42229] Another function of VGAM1176 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275), a gene which is a novel interleukin-1 receptor antagonist gene. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM263. Matrix Metalloproteinase 19 (MMP19, Accession NM_022791) is another VGAM1176 host target gene. MMP19 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE, designated SEQ ID:23080, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42230] Another function of VGAM1176 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM_022791). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP19. Nuclear RNA Export Factor 2 (NXF2, Accession NM_022053) is another VGAM1176 host target gene. NXF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NXF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXF2 BINDING SITE, designated SEQ ID:22591, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42231] Another function of VGAM1176 is therefore inhibition of Nuclear RNA Export Factor 2 (NXF2, Accession NM_022053), a gene which is involved in the export of mrna from the nucleus to the cytoplasm. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXF2. The function of NXF2 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM595. Oligophrenin 1 (OPHN1, Accession NM_002547) is another VGAM1176 host target gene.

OPHN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:8406, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42232] Another function of VGAM1176 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM_002547). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1. Podocalyxin-like (PODXL, Accession NM_005397) is another VGAM1176 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PODXL BINDING SITE, designated SEQ ID:11873, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42233] Another function of VGAM1176 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Ribonuclease, RNase A Family, 1 (pancreatic) (RNASE1, Accession NM_002933) is another VGAM1176 host target gene. RNASE1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RNASE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNASE1 BINDING SITE, designated SEQ ID:8837, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42234] Another function of VGAM1176 is therefore inhibition of Ribonuclease, RNase A Family, 1 (pancreatic) (RNASE1, Accession NM_002933), a gene which is a Pancreatic ribonuclease; a pyrimidine-specific endonuclease that generates 2',3'-cyclic phosphate products. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNASE1. The function of RNASE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210. Caspase Recruitment Domain Family, Member 14 (CARD14, Accession NM_052819) is another VGAM1176 host target gene. CARD14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CARD14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD14 BINDING SITE, designated SEQ ID:27407, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42235] Another function of VGAM1176 is therefore inhibition of Caspase Recruitment Domain Family, Member 14

(CARD14, Accession NM_052819). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD14. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273) is another VGAM1176 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10482, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42236] Another function of VGAM1176 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. DKFZP586B2420 (Accession XM_059482) is another VGAM1176 host target gene. DKFZP586B2420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586B2420,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586B2420 BINDING SITE, designated SEQ ID:37010, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42237] Another function of VGAM1176 is therefore inhibition of DKFZP586B2420 (Accession XM_059482). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586B2420. DKFZp586I021 (Accession NM_032271) is another VGAM1176 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26023, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42238] Another function of VGAM1176 is therefore inhibition of

DKFZp586I021 (Accession NM_032271). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. DRIL2 (Accession NM_006465) is another VGAM1176 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13186, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42239] Another function of VGAM1176 is therefore inhibition of DRIL2 (Accession NM_006465). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. FLB6421 (Accession NM_020119) is another VGAM1176 host target gene. FLB6421 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLB6421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLB6421 BINDING SITE, designated SEQ ID:21301, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42240] Another function of VGAM1176 is therefore inhibition of FLB6421 (Accession NM_020119). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLB6421. FLJ10521 (Accession NM_018125) is another VGAM1176 host target gene. FLJ10521 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10521 BINDING SITE, designated SEQ ID:19910, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42241] Another function of VGAM1176 is therefore inhibition of FLJ10521 (Accession NM_018125). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10521. FLJ10620 (Accession NM_018157) is another

VGAM1176 host target gene. FLJ10620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10620 BINDING SITE, designated SEQ ID:19975, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42242] Another function of VGAM1176 is therefore inhibition of FLJ10620 (Accession NM_018157). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10620. FLJ10751 (Accession NM_018205) is another VGAM1176 host target gene. FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10751, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2, designated SEQ ID:20090 and SEQ ID:20189 respectively, to the nucleotide sequence of

VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42243] Another function of VGAM1176 is therefore inhibition of FLJ10751 (Accession NM_018205). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751. FLJ12547 (Accession NM_024992) is another VGAM1176 host target gene. FLJ12547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12547 BINDING SITE, designated SEQ ID:24547, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42244] Another function of VGAM1176 is therefore inhibition of FLJ12547 (Accession NM_024992). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12547. FLJ31709 (Accession NM_144636) is another VGAM1176 host target gene. FLJ31709 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ31709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31709 BINDING SITE, designated SEQ ID:29459, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42245] Another function of VGAM1176 is therefore inhibition of FLJ31709 (Accession NM_144636). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31709. Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM1176 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32533, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42246] Another function of VGAM1176 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession

XM_036937). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. KIAA0317 (Accession NM_014821) is another VGAM1176 host target gene.

KIAA0317 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0317 BINDING SITE, designated SEQ ID:16794, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42247] Another function of VGAM1176 is therefore inhibition of KIAA0317 (Accession NM_014821). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0317. KIAA0417 (Accession XM_048898) is another VGAM1176 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0417 BINDING SITE, designated SEQ ID:35292, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42248] Another function of VGAM1176 is therefore inhibition of KIAA0417 (Accession XM_048898). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. KIAA0574 (Accession XM_045076) is another VGAM1176 host target gene. KIAA0574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0574 BINDING SITE, designated SEQ ID:34344, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42249] Another function of VGAM1176 is therefore inhibition of KIAA0574 (Accession XM_045076). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0574. KIAA0939 (Accession XM_030524) is another

VGAM1176 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31066, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42250] Another function of VGAM1176 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA1211 (Accession XM_044178) is another VGAM1176 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1211 BINDING SITE, designated SEQ ID:34166, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42251] Another function of VGAM1176 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. KIAA1580 (Accession XM_045271) is another VGAM1176 host target gene. KIAA1580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1580 BINDING SITE, designated SEQ ID:34407, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42252] Another function of VGAM1176 is therefore inhibition of KIAA1580 (Accession XM_045271). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1580. KIAA1879 (Accession XM_056635) is another VGAM1176 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36415, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42253] Another function of VGAM1176 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM_018697) is another VGAM1176 host target gene. LANCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL2 BINDING SITE, designated SEQ ID:20776, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42254] Another function of VGAM1176 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM_018697). Accordingly,

utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL2. MAC30 (Accession XM_031536) is another VGAM1176 host target gene. MAC30 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAC30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAC30 BINDING SITE, designated SEQ ID:31405, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42255] Another function of VGAM1176 is therefore inhibition of MAC30 (Accession XM_031536). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAC30. Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP3K3, Accession NM_002401) is another VGAM1176 host target gene. MAP3K3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAP3K3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MAP3K3 BINDING SITE, designated SEQ ID:8224, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42256] Another function of VGAM1176 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP3K3, Accession NM_002401). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K3. MGC4368 (Accession NM_024510) is another VGAM1176 host target gene. MGC4368 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4368 BINDING SITE, designated SEQ ID:23699, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42257] Another function of VGAM1176 is therefore inhibition of MGC4368 (Accession NM_024510). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC4368. NIFU (Accession XM_041081) is another VGAM1176 host target gene. NIFU BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NIFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIFU BINDING SITE, designated SEQ ID:33437, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42258] Another function of VGAM1176 is therefore inhibition of NIFU (Accession XM_041081). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIFU. RALGPS1A (Accession NM_014636) is another VGAM1176 host target gene. RALGPS1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RALGPS1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALGPS1A BINDING SITE, designated SEQ ID:16017, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA,

also designated SEQ ID:3887.

[42259] Another function of VGAM1176 is therefore inhibition of RALGPS1A (Accession NM_014636). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALGPS1A. TED (Accession NM_015686) is another VGAM1176 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17916, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42260] Another function of VGAM1176 is therefore inhibition of TED (Accession NM_015686). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. LOC115129 (Accession XM_055292) is another VGAM1176 host target gene. LOC115129 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115129, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36254, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42261] Another function of VGAM1176 is therefore inhibition of LOC115129 (Accession XM_055292). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. LOC124977 (Accession XM_071942) is another VGAM1176 host target gene. LOC124977 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC124977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124977 BINDING SITE, designated SEQ ID:37448, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42262] Another function of VGAM1176 is therefore inhibition of LOC124977 (Accession XM_071942). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC124977. LOC138399 (Accession XM_059971) is another VGAM1176 host target gene. LOC138399 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138399 BINDING SITE, designated SEQ ID:37132, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42263] Another function of VGAM1176 is therefore inhibition of LOC138399 (Accession XM_059971). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138399. LOC142941 (Accession XM_096363) is another VGAM1176 host target gene. LOC142941 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC142941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142941 BINDING SITE, designated SEQ ID:40323, to

the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42264] Another function of VGAM1176 is therefore inhibition of LOC142941 (Accession XM_096363). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142941. LOC144481 (Accession XM_096611) is another VGAM1176 host target gene. LOC144481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144481 BINDING SITE, designated SEQ ID:40420, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42265] Another function of VGAM1176 is therefore inhibition of LOC144481 (Accession XM_096611). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144481. LOC146138 (Accession XM_096938) is another VGAM1176 host target gene. LOC146138 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC146138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146138 BINDING SITE, designated SEQ ID:40657, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42266] Another function of VGAM1176 is therefore inhibition of LOC146138 (Accession XM_096938). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146138. LOC146333 (Accession XM_091306) is another VGAM1176 host target gene. LOC146333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146333 BINDING SITE, designated SEQ ID:40045, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42267] Another function of VGAM1176 is therefore inhibition of LOC146333 (Accession XM_091306). Accordingly, utilities

of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146333. LOC149175 (Accession XM_086445) is another VGAM1176 host target gene. LOC149175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149175 BINDING SITE, designated SEQ ID:38663, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42268] Another function of VGAM1176 is therefore inhibition of LOC149175 (Accession XM_086445). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149175. LOC153883 (Accession XM_087798) is another VGAM1176 host target gene. LOC153883 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC153883 BINDING SITE, designated SEQ ID:39432, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42269] Another function of VGAM1176 is therefore inhibition of LOC153883 (Accession XM_087798). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153883. LOC157931 (Accession XM_098845) is another VGAM1176 host target gene. LOC157931 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157931 BINDING SITE, designated SEQ ID:41905, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42270] Another function of VGAM1176 is therefore inhibition of LOC157931 (Accession XM_098845). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157931. LOC196759 (Accession XM_113601) is another VGAM1176 host target gene. LOC196759 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196759 BINDING SITE, designated SEQ ID:42296, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42271] Another function of VGAM1176 is therefore inhibition of LOC196759 (Accession XM_113601). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196759. LOC199864 (Accession XM_117146) is another VGAM1176 host target gene. LOC199864 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199864, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199864 BINDING SITE, designated SEQ ID:43252, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42272] Another function of VGAM1176 is therefore inhibition of

LOC199864 (Accession XM_117146). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199864. LOC200734 (Accession XM_114286) is another VGAM1176 host target gene. LOC200734 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200734 BINDING SITE, designated SEQ ID:42842, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42273] Another function of VGAM1176 is therefore inhibition of LOC200734 (Accession XM_114286). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200734. LOC202934 (Accession XM_117486) is another VGAM1176 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43454, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42274] Another function of VGAM1176 is therefore inhibition of LOC202934 (Accession XM_117486). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC220776 (Accession XM_043388) is another VGAM1176 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33937, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42275] Another function of VGAM1176 is therefore inhibition of LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC253868 (Accession XM_170975) is an-

other VGAM1176 host target gene. LOC253868 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253868 BINDING SITE, designated SEQ ID:45749, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42276] Another function of VGAM1176 is therefore inhibition of LOC253868 (Accession XM_170975). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253868. LOC254045 (Accession XM_172882) is another VGAM1176 host target gene. LOC254045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254045 BINDING SITE, designated SEQ ID:46162, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42277] Another function of VGAM1176 is therefore inhibition of LOC254045 (Accession XM_172882). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254045. LOC255465 (Accession XM_173206) is another VGAM1176 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46448, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42278] Another function of VGAM1176 is therefore inhibition of LOC255465 (Accession XM_173206). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. LOC91351 (Accession XM_037817) is another VGAM1176 host target gene. LOC91351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91351, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91351 BINDING SITE, designated SEQ ID:32699, to the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, also designated SEQ ID:3887.

[42279] Another function of VGAM1176 is therefore inhibition of LOC91351 (Accession XM_037817). Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91351. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1177 (VGAM1177) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42280] VGAM1177 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1177 was detected is described hereinabove with reference to Figs. 1-8.

[42281] VGAM1177 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Odontoglossum Ringspot Virus. VGAM1177 host target gene, herein des-

ignated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42282] VGAM1177 gene encodes a VGAM1177 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1177 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1177 precursor RNA is designated SEQ ID:1163, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1163 is located at position 4157 relative to the genome of Odontoglossum Ringspot Virus.

[42283] VGAM1177 precursor RNA folds onto itself, forming VGAM1177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42284] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1177 folded precursor RNA into VGAM1177

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1177 RNA is designated SEQ ID:3888, and is provided hereinbelow with reference to the sequence listing part.

[42285] VGAM1177 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1177 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42286] VGAM1177 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1177 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1177 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42287] The complementary binding of VGAM1177 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1177 host target RNA into VGAM1177 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[42288] It is appreciated that VGAM1177 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1177 host target genes. The mRNA of each one of this plurality of VGAM1177 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1177 RNA, herein designated VGAM RNA, and which when bound by VGAM1177 RNA causes inhibition of translation of respective one or more VGAM1177 host target proteins.

[42289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1177 gene, herein designated VGAM GENE, on one or more VGAM1177 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42290] It is yet further appreciated that a function of VGAM1177 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1177 include diagnosis, prevention and treatment of viral infection by Odontoglossum Ringspot Virus. Specific functions, and accordingly utilities, of VGAM1177 correlate with, and may be deduced from, the identity of the host target genes which VGAM1177 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42291] Nucleotide sequences of the VGAM1177 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1177 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1177 are further described hereinbelow with reference to Table 1.

[42292] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1177 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1177 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42293] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1177 gene, herein designated VGAM is inhibition of expression of VGAM1177 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1177 correlate with, and may be deduced from, the identity of the target genes which VGAM1177 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42294] Moesin (MSN, Accession XM_013042) is a VGAM1177 host target gene. MSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSN BINDING SITE, designated SEQ ID:30226, to the nucleotide sequence of VGAM1177 RNA, herein designated VGAM RNA, also designated SEQ

ID:3888.

[42295] A function of VGAM1177 is therefore inhibition of Moesin (MSN, Accession XM_013042), a gene which may have a role linking the cytoskeleton to the plasma membrane. Accordingly, utilities of VGAM1177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSN. The function of MSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM248. RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM_134422) is another VGAM1177 host target gene. RAD52 BINDING SITE1 through RAD52 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE1 through RAD52 BINDING SITE3, designated SEQ ID:28642, SEQ ID:28652 and SEQ ID:28661 respectively, to the nucleotide sequence of VGAM1177 RNA, herein designated VGAM RNA, also designated SEQ ID:3888.

[42296] Another function of VGAM1177 is therefore inhibition of

RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM_134422). Accordingly, utilities of VGAM1177 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. LOC136288 (Accession XM_059832) is another VGAM1178 host target gene. LOC136288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC136288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136288 BINDING SITE, designated SEQ ID:37098, to the nucleotide sequence of VGAM1178 RNA, herein designated VGAM RNA, also designated SEQ ID:3889.

[42297] Another function of VGAM1178 is therefore inhibition of LOC136288 (Accession XM_059832). Accordingly, utilities of VGAM1178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136288. LOC51333 (Accession NM_016643) is another VGAM1178 host target gene. LOC51333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51333, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51333 BINDING SITE, designated SEQ ID:18749, to the nucleotide sequence of VGAM1178 RNA, herein designated VGAM RNA, also designated SEQ ID:3889.

[42298] Another function of VGAM1178 is therefore inhibition of LOC51333 (Accession NM_016643). Accordingly, utilities of VGAM1178 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1179 (VGAM1179) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42299] VGAM1179 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1179 was detected is described hereinabove with reference to Figs. 1-8.

[42300] VGAM1179 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Odontoglossum Ringspot Virus. VGAM1179 host target gene, herein des-

ignated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42301] VGAM1179 gene encodes a VGAM1179 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1179 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1179 precursor RNA is designated SEQ ID:1165, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1165 is located at position 5650 relative to the genome of Odontoglossum Ringspot Virus.

[42302] VGAM1179 precursor RNA folds onto itself, forming VGAM1179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42303] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1179 folded precursor RNA into VGAM1179

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1179 RNA is designated SEQ ID:3890, and is provided hereinbelow with reference to the sequence listing part.

[42304] VGAM1179 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1179 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42305] VGAM1179 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1179 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1179 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42306] The complementary binding of VGAM1179 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1179 host target RNA into VGAM1179 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[42307] It is appreciated that VGAM1179 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1179 host target genes. The mRNA of each one of this plurality of VGAM1179 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1179 RNA, herein designated VGAM RNA, and which when bound by VGAM1179 RNA causes inhibition of translation of respective one or more VGAM1179 host target proteins.

[42308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1179 gene, herein designated VGAM GENE, on one or more VGAM1179 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42309] It is yet further appreciated that a function of VGAM1179 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1179 include diagnosis, prevention and treatment of viral infection by Odontoglossum Ringspot Virus. Specific functions, and accordingly utilities, of VGAM1179 correlate with, and may be deduced from, the identity of the host target genes which VGAM1179 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42310] Nucleotide sequences of the VGAM1179 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1179 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1179 are further described hereinbelow with reference to Table 1.

[42311] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1179 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1179 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42312] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1179 gene, herein designated VGAM is inhibition of expression of VGAM1179 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1179 correlate with, and may be deduced from, the identity of the target genes which VGAM1179 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42313] ARPP-19 (Accession NM_006628) is a VGAM1179 host target gene. ARPP-19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:13417, to the nucleotide sequence of VGAM1179 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3890.

[42314] A function of VGAM1179 is therefore inhibition of ARPP-19 (Accession NM_006628). Accordingly, utilities of VGAM1179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19. LOC51141 (Accession XM_043953) is another VGAM1179 host target gene. LOC51141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51141 BINDING SITE, designated SEQ ID:34051, to the nucleotide sequence of VGAM1179 RNA, herein designated VGAM RNA, also designated SEQ ID:3890.

[42315] Another function of VGAM1179 is therefore inhibition of LOC51141 (Accession XM_043953). Accordingly, utilities of VGAM1179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51141. LOC91050 (Accession XM_035703) is another VGAM1179 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91050, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32332, to the nucleotide sequence of VGAM1179 RNA, herein designated VGAM RNA, also designated SEQ ID:3890.

[42316] Another function of VGAM1179 is therefore inhibition of LOC91050 (Accession XM_035703). Accordingly, utilities of VGAM1179 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1180 (VGAM1180) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42317] VGAM1180 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1180 was detected is described hereinabove with reference to Figs. 1-8.

[42318] VGAM1180 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Odontoglossum*

Ringspot Virus. VGAM1180 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42319] VGAM1180 gene encodes a VGAM1180 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1180 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1180 precursor RNA is designated SEQ ID:1166, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1166 is located at position 2834 relative to the genome of Odontoglossum Ringspot Virus.

[42320] VGAM1180 precursor RNA folds onto itself, forming VGAM1180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42321] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1180 folded precursor RNA into VGAM1180 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1180 RNA is designated SEQ ID:3891, and is provided hereinbelow with reference to the sequence listing part.

[42322] VGAM1180 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1180 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42323] VGAM1180 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1180 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1180 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42324] The complementary binding of VGAM1180 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1180 host target RNA into VGAM1180 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42325] It is appreciated that VGAM1180 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1180 host target genes. The mRNA of each one of this plurality of VGAM1180 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1180 RNA, herein designated VGAM RNA, and which when bound by VGAM1180 RNA causes inhibition of translation of respective one or more VGAM1180 host target proteins.

[42326] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1180 gene, herein designated VGAM GENE, on one or more VGAM1180 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42327] It is yet further appreciated that a function of VGAM1180 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1180 include diagnosis, prevention and treatment of viral infection by Odontoglossum Ringspot Virus. Specific functions, and accordingly utilities, of VGAM1180 correlate with, and may be deduced from, the identity of the host target genes which VGAM1180 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42328] Nucleotide sequences of the VGAM1180 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1180 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1180 are further described hereinbelow with reference to Table 1.

[42329] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1180 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1180 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42330] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1180 gene, herein designated VGAM is inhibition of expression of VGAM1180 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1180 correlate with, and may be deduced from, the identity of the target genes which VGAM1180 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42331] ATPase, H⁺ Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 2 (ATP6V1G2, Accession NM_130463) is a VGAM1180 host target gene. ATP6V1G2 BINDING SITE1 and ATP6V1G2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATP6V1G2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ATP6V1G2 BINDING SITE1 and ATP6V1G2 BINDING SITE2, designated SEQ ID:28225 and SEQ ID:28698 respectively, to the nucleotide sequence of VGAM1180 RNA, herein designated VGAM RNA, also designated SEQ ID:3891.

[42332] A function of VGAM1180 is therefore inhibition of ATPase, H⁺ Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 2 (ATP6V1G2, Accession NM_130463). Accordingly, utilities of VGAM1180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1G2. Major Histocompatibility Complex, Class II, DQ Alpha 1 (HLA-DQA1, Accession XM_175260) is another VGAM1180 host target gene. HLA-DQA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HLA-DQA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLA-DQA1 BINDING SITE, designated SEQ ID:46726, to the nucleotide sequence of VGAM1180 RNA, herein designated VGAM RNA, also designated SEQ ID:3891.

[42333] Another function of VGAM1180 is therefore inhibition of Major Histocompatibility Complex, Class II, DQ Alpha 1

(HLA-DQA1, Accession XM_175260), a gene which is alpha 1 chain of HLA-DQ1 class II molecule (Ia antigen) which binds peptides and presents them to CD4+ T lymphocytes. Accordingly, utilities of VGAM1180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLA-DQA1. The function of HLA-DQA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.CG018 (Accession NM_052818) is another VGAM1180 host target gene. CG018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CG018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG018 BINDING SITE, designated SEQ ID:27405, to the nucleotide sequence of VGAM1180 RNA, herein designated VGAM RNA, also designated SEQ ID:3891.

[42334] Another function of VGAM1180 is therefore inhibition of CG018 (Accession NM_052818). Accordingly, utilities of VGAM1180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG018.

E2F Transcription Factor 6 (E2F6, Accession NM_001952) is another VGAM1180 host target gene. E2F6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F6 BINDING SITE, designated SEQ ID:7676, to the nucleotide sequence of VGAM1180 RNA, herein designated VGAM RNA, also designated SEQ ID:3891.

[42335] Another function of VGAM1180 is therefore inhibition of E2F Transcription Factor 6 (E2F6, Accession NM_001952). Accordingly, utilities of VGAM1180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F6. FLJ10261 (Accession NM_018043) is another VGAM1180 host target gene. FLJ10261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10261 BINDING SITE, designated SEQ ID:19789, to the nucleotide sequence of VGAM1180 RNA,

herein designated VGAM RNA, also designated SEQ ID:3891.

[42336] Another function of VGAM1180 is therefore inhibition of FLJ10261 (Accession NM_018043). Accordingly, utilities of VGAM1180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10261. LOC92573 (Accession XM_045884) is another VGAM1180 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34600, to the nucleotide sequence of VGAM1180 RNA, herein designated VGAM RNA, also designated SEQ ID:3891.

[42337] Another function of VGAM1180 is therefore inhibition of LOC92573 (Accession XM_045884). Accordingly, utilities of VGAM1180 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1181 (VGAM1181) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42338] VGAM1181 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1181 was detected is described hereinabove with reference to Figs. 1-8.

[42339] VGAM1181 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Odontoglossum Ringspot Virus. VGAM1181 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42340] VGAM1181 gene encodes a VGAM1181 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1181 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1181 precursor RNA is designated SEQ ID:1167, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1167 is located at position 4926 relative to the genome of Odontoglossum Ringspot Virus.

[42341] VGAM1181 precursor RNA folds onto itself, forming VGAM1181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42342] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1181 folded precursor RNA into VGAM1181 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1181 RNA is designated SEQ ID:3892, and is provided hereinbelow with reference to the sequence listing part.

[42343] VGAM1181 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1181 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1181 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42344] VGAM1181 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1181 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1181 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42345] The complementary binding of VGAM1181 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1181 host target RNA into VGAM1181 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42346] It is appreciated that VGAM1181 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1181 host target genes. The mRNA of each one of this plurality of VGAM1181 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1181 RNA, herein designated VGAM RNA, and which when bound by VGAM1181 RNA causes inhibition of translation of respective one or more VGAM1181 host target proteins.

[42347] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1181 gene, herein designated VGAM GENE, on one or more VGAM1181 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42348] It is yet further appreciated that a function of VGAM1181 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1181 include diagnosis, prevention and treatment of viral infection by Odontoglossum Ringspot Virus. Specific functions, and accordingly utilities, of VGAM1181 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1181 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42349] Nucleotide sequences of the VGAM1181 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1181 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1181 are further described hereinbelow with reference to Table 1.

[42350] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1181 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1181 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42351] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1181 gene, herein designated VGAM is inhibition of expression of VGAM1181 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1181 correlate with, and may be deduced from, the identity of the target genes which VGAM1181

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42352] FLJ14600 (Accession NM_032810) is a VGAM1181 host target gene. FLJ14600 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14600 BINDING SITE, designated SEQ ID:26576, to the nucleotide sequence of VGAM1181 RNA, herein designated VGAM RNA, also designated SEQ ID:3892.

[42353] A function of VGAM1181 is therefore inhibition of FLJ14600 (Accession NM_032810). Accordingly, utilities of VGAM1181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14600. KIAA0596 (Accession XM_031706) is another VGAM1181 host target gene. KIAA0596 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0596 BINDING SITE, designated SEQ ID:31465, to the nucleotide sequence of VGAM1181 RNA, herein designated VGAM RNA, also designated SEQ ID:3892.

[42354] Another function of VGAM1181 is therefore inhibition of KIAA0596 (Accession XM_031706). Accordingly, utilities of VGAM1181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0596. KIAA1373 (Accession XM_048195) is another VGAM1181 host target gene. KIAA1373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:35123, to the nucleotide sequence of VGAM1181 RNA, herein designated VGAM RNA, also designated SEQ ID:3892.

[42355] Another function of VGAM1181 is therefore inhibition of KIAA1373 (Accession XM_048195). Accordingly, utilities of VGAM1181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1373. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863) is another

VGAM1181 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11288, to the nucleotide sequence of VGAM1181 RNA, herein designated VGAM RNA, also designated SEQ ID:3892.

[42356] Another function of VGAM1181 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863). Accordingly, utilities of VGAM1181 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1182 (VGAM1182) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42357] VGAM1182 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1182 was detected is described hereinabove with reference to Figs. 1–8.

[42358] VGAM1182 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 4. VGAM1182 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42359] VGAM1182 gene encodes a VGAM1182 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1182 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1182 precursor RNA is designated SEQ ID:1168, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1168 is located at position 110159 relative to the genome of Human Herpesvirus 4.

[42360] VGAM1182 precursor RNA folds onto itself, forming VGAM1182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42361] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1182 folded precursor RNA into VGAM1182 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1182 RNA is designated SEQ ID:3893, and is provided hereinbelow with reference to the sequence listing part.

[42362] VGAM1182 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1182 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42363] VGAM1182 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1182 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1182 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[42364] The complementary binding of VGAM1182 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1182 host target RNA into VGAM1182 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42365] It is appreciated that VGAM1182 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1182 host target genes. The mRNA of each one of this plurality of VGAM1182 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1182 RNA, herein designated VGAM RNA, and which when bound by VGAM1182 RNA causes inhibition of translation of respective one or more VGAM1182 host target proteins.

[42366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1182 gene, herein designated VGAM GENE, on one or more VGAM1182 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42367] It is yet further appreciated that a function of VGAM1182 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1182 correlate with, and may be deduced from, the identity of the host target genes which VGAM1182 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42368] Nucleotide sequences of the VGAM1182 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1182 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1182 are further described hereinbelow with reference to Table 1.

[42369] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1182 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1182 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42370] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1182 gene, herein designated VGAM is inhibition of expression of VGAM1182 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1182 correlate with, and may be deduced from, the identity of the target genes which VGAM1182 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42371] High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483) is a VGAM1182 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGA2, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9559, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42372] A function of VGAM1182 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Interferon, Gamma-inducible Protein 16 (IFI16, Accession XM_048826) is another VGAM1182 host target gene. IFI16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IFI16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of IFI16 BINDING SITE, designated SEQ ID:35281, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42373] Another function of VGAM1182 is therefore inhibition of Interferon, Gamma-inducible Protein 16 (IFI16, Accession XM_048826), a gene which could have a role in the regulation of hematopoietic differentiation and controls cellular proliferation. Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFI16. The function of IFI16 has been established by previous studies. The interferons are a family of vertebrate cytokines with pleiotropic activities including antiviral effects, the regulation of cell growth and differentiation, and modulation of immune function. Interferon-gamma (IFNG; 147570) causes an increase in the expression of major histocompatibility complex (MHC) class I and class II proteins on a variety of cells, serving to enhance antigen presentation and recognition of foreign cell surface antigens by MHC-restricted cytotoxic T lymphocytes. At least 6 interferon-gamma-inducible genes located on mouse chromosome 1 were described by Choubey et al. (1989), Kingsmore et al.

(1989), and others. In the mouse, the genes mapped to a 150-kb segment of DNA, and the serum amyloid P component gene (Sap; OMIM Ref. No. 104770) mapped within approximately 450 kb of the IFN-inducible gene cluster. The erythrocyte alpha-spectrin gene (see OMIM Ref. No. 182860) was also closely linked. Trapani et al. (1992) described a human IFN-gamma-inducible gene, IFI16, which has nucleotide sequence similarity with portions of 2 of the mouse genes. A full-length cDNA clone contained a single open reading frame of 2,187 bp which encoded a putative polypeptide of 729 amino acids. IFI16 mRNA was found to be constitutively expressed in lymphoid cells and in cell lines of both the T and B lineages. By contrast, the mRNA was not expressed in cell lines that represent early stages of myeloid development, although it was inducible in 2 of these lines with interferon-gamma. Using a panel of interspecies somatic cell hybrid cell lines, Trapani et al. (1992) localized the IFI16 gene to human 1q12-qter. DNA blotting indicated that, in contrast to the mouse, IFI16 is present as a single-copy gene in the human genome.

[42374] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [42375] Kingsmore, S. F.; Snoddy, J.; Choubey, D.; Lengyel, P.; Seldin, M. F. : Physical mapping of a family of interferon-activated genes, serum amyloid P-component, and alpha-spectrin on mouse chromosome 1. Immunogenetics 30: 169-174, 1989. ; and
- [42376] Trapani, J. A.; Browne, K. A.; Dawson, M. J.; Ramsay, R. G.; Eddy, R. L.; Shows, T. B.; White, P. C.; Dupont, B. : A novel gene constitutively expressed in human lymphoid cells is induc.
- [42377] Further studies establishing the function and utilities of IFI16 are found in John Hopkins OMIM database record ID 147586, and in cited publications numbered 3688, 420 and 11161 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499) is another VGAM1182 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEO1 BINDING SITE, designated SEQ ID:8314, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA,

also designated SEQ ID:3893.

[42378] Another function of VGAM1182 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. TIRAP (Accession NM_052887) is another VGAM1182 host target gene. TIRAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIRAP BINDING SITE, designated SEQ ID:27473, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42379] Another function of VGAM1182 is therefore inhibition of TIRAP (Accession NM_052887), a gene which is a adapter involved in the TLR4 signaling pathway in the innate im-

mune response. Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIRAP. The function of TIRAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189. BTB (POZ) Domain Containing 2 (BTBD2, Accession NM_017797) is another VGAM1182 host target gene. BTBD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTBD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD2 BINDING SITE, designated SEQ ID:19438, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42380] Another function of VGAM1182 is therefore inhibition of BTB (POZ) Domain Containing 2 (BTBD2, Accession NM_017797). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD2. FGD1 Family, Member 3 (FGD3, Accession XM_053487) is another

VGAM1182 host target gene. FGD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGD3 BINDING SITE, designated SEQ ID:36092, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42381] Another function of VGAM1182 is therefore inhibition of FGD1 Family, Member 3 (FGD3, Accession XM_053487). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGD3. FLJ21791 (Accession XM_028958) is another VGAM1182 host target gene. FLJ21791 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21791, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21791 BINDING SITE, designated SEQ ID:30808, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ

ID:3893.

[42382] Another function of VGAM1182 is therefore inhibition of FLJ21791 (Accession XM_028958). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21791. GBTS1 (Accession NM_145173) is another VGAM1182 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE, designated SEQ ID:29726, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42383] Another function of VGAM1182 is therefore inhibition of GBTS1 (Accession NM_145173). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBTS1. KIAA1257 (Accession XM_031577) is another VGAM1182 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31428, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42384] Another function of VGAM1182 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. SBBI26 (Accession NM_018846) is another VGAM1182 host target gene. SBBI26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SBBI26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBBI26 BINDING SITE, designated SEQ ID:20829, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42385] Another function of VGAM1182 is therefore inhibition of SBBI26 (Accession NM_018846). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SBBI26. LOC124602 (Accession XM_058829) is another VGAM1182 host target gene. LOC124602 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124602 BINDING SITE, designated SEQ ID:36756, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42386] Another function of VGAM1182 is therefore inhibition of LOC124602 (Accession XM_058829). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124602. LOC132235 (Accession XM_072302) is another VGAM1182 host target gene. LOC132235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC132235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132235 BINDING SITE, designated SEQ ID:37479, to

the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42387] Another function of VGAM1182 is therefore inhibition of LOC132235 (Accession XM_072302). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132235. LOC158295 (Accession XM_098915) is another VGAM1182 host target gene. LOC158295 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158295 BINDING SITE, designated SEQ ID:41936, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42388] Another function of VGAM1182 is therefore inhibition of LOC158295 (Accession XM_098915). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158295. LOC200940 (Accession XM_114324) is another VGAM1182 host target gene. LOC200940 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC200940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200940 BINDING SITE, designated SEQ ID:42874, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42389] Another function of VGAM1182 is therefore inhibition of LOC200940 (Accession XM_114324). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200940. LOC201685 (Accession XM_117325) is another VGAM1182 host target gene. LOC201685 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201685 BINDING SITE, designated SEQ ID:43383, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42390] Another function of VGAM1182 is therefore inhibition of LOC201685 (Accession XM_117325). Accordingly, utilities

of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201685. LOC203397 (Accession XM_114695) is another VGAM1182 host target gene. LOC203397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203397 BINDING SITE, designated SEQ ID:43036, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42391] Another function of VGAM1182 is therefore inhibition of LOC203397 (Accession XM_114695). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203397. LOC254413 (Accession XM_173141) is another VGAM1182 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254413 BINDING SITE, designated SEQ ID:46397, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42392] Another function of VGAM1182 is therefore inhibition of LOC254413 (Accession XM_173141). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. LOC57228 (Accession NM_020467) is another VGAM1182 host target gene. LOC57228 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC57228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57228 BINDING SITE, designated SEQ ID:21705, to the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, also designated SEQ ID:3893.

[42393] Another function of VGAM1182 is therefore inhibition of LOC57228 (Accession NM_020467). Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57228. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1183 (VGAM1183) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42394] VGAM1183 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1183 was detected is described hereinabove with reference to Figs. 1–8.

[42395] VGAM1183 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cactus Virus X. VGAM1183 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42396] VGAM1183 gene encodes a VGAM1183 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1183 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1183 precursor RNA is designated SEQ ID:1169, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1169 is located at position 6096 relative to the

genome of Cactus Virus X.

[42397] VGAM1183 precursor RNA folds onto itself, forming VGAM1183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42398] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1183 folded precursor RNA into VGAM1183 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1183 RNA is designated SEQ ID:3894, and is provided hereinbelow with reference to the sequence listing part.

[42399] VGAM1183 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1183 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[42400] VGAM1183 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1183 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1183 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42401] The complementary binding of VGAM1183 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1183 host target RNA into VGAM1183 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42402] It is appreciated that VGAM1183 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1183 host target genes. The mRNA of each one of this plurality of VGAM1183 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1183 RNA, herein designated VGAM RNA, and which when bound by VGAM1183 RNA causes inhibition of translation of respective one or more VGAM1183 host target proteins.

[42403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1183 gene, herein designated VGAM GENE, on one or more VGAM1183 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42404] It is yet further appreciated that a function of VGAM1183 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of viral infection by Cactus Virus X. Specific functions, and accordingly utilities, of VGAM1183 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1183 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42405] Nucleotide sequences of the VGAM1183 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1183 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1183 are further described hereinbelow with reference to Table 1.

[42406] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1183 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1183 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42407] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1183 gene, herein designated VGAM is inhibition of expression of VGAM1183 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1183 correlate with, and may be deduced

from, the identity of the target genes which VGAM1183 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42408] Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is a VGAM1183 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7732, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42409] A function of VGAM1183 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Phosphodiesterase 4D, CAMP-specific

(phosphodiesterase E3 dunce homolog, *Drosophila*) (PDE4D, Accession XM_056815) is another VGAM1183 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36431, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42410] Another function of VGAM1183 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, *Drosophila*) (PDE4D, Accession XM_056815), a gene which has similarity to *Drosophila* dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Prostaglandin-endoperoxide Synthase 2

(prostaglandin G/H synthase and cyclooxygenase) (PTGS2, Accession NM_000963) is another VGAM1183 host target gene. PTGS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS2 BINDING SITE, designated SEQ ID:6682, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42411] Another function of VGAM1183 is therefore inhibition of Prostaglandin-endoperoxide Synthase 2 (prostaglandin G/H synthase and cyclooxygenase) (PTGS2, Accession NM_000963), a gene which may have a role as a major mediator of inflammation and/or a role for prostanoid signaling in activity-dependent plasticity. Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS2. The function of PTGS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM292.RAD50 Homolog (*S. cere-*

visiae) (RAD50, Accession NM_005732) is another VGAM1183 host target gene. RAD50 BINDING SITE1 and RAD50 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD50, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE1 and RAD50 BINDING SITE2, designated SEQ ID:12292 and SEQ ID:28549 respectively, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42412] Another function of VGAM1183 is therefore inhibition of RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession NM_005732), a gene which is involved in dna double-strand break repair (dsbr). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD50. The function of RAD50 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132. Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM_005839) is another VGAM1183 host target

gene. SRRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRRM1 BINDING SITE, designated SEQ ID:12448, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42413] Another function of VGAM1183 is therefore inhibition of Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM_005839). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRRM1. SUV39H2 (Accession NM_024670) is another VGAM1183 host target gene. SUV39H2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUV39H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUV39H2 BINDING SITE, designated SEQ ID:23973, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ

ID:3894.

[42414] Another function of VGAM1183 is therefore inhibition of SUV39H2 (Accession NM_024670), a gene which is involved in gene repression and the modification of position-effect-variegation. Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUV39H2. The function of SUV39H2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM424. Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788) is another VGAM1183 host target gene. UBE4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE4A BINDING SITE, designated SEQ ID:11194, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42415] Another function of VGAM1183 is therefore inhibition of Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A,

Accession NM_004788), a gene which binds to the ubiquitin moieties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3. Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE4A. The function of UBE4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.FLJ25422 (Accession NM_145000) is another VGAM1183 host target gene. FLJ25422 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ25422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25422 BINDING SITE, designated SEQ ID:29603, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42416] Another function of VGAM1183 is therefore inhibition of FLJ25422 (Accession NM_145000). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ25422. KIAA1254 (Accession XM_046132) is another VGAM1183 host target gene. KIAA1254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1254 BINDING SITE, designated SEQ ID:34695, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42417] Another function of VGAM1183 is therefore inhibition of KIAA1254 (Accession XM_046132). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1254. MGC3040 (Accession XM_039805) is another VGAM1183 host target gene. MGC3040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3040 BINDING SITE, designated SEQ ID:33195, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM

RNA, also designated SEQ ID:3894.

[42418] Another function of VGAM1183 is therefore inhibition of MGC3040 (Accession XM_039805). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3040. MGC32043 (Accession NM_144582) is another VGAM1183 host target gene. MGC32043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC32043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32043 BINDING SITE, designated SEQ ID:29390, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42419] Another function of VGAM1183 is therefore inhibition of MGC32043 (Accession NM_144582). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32043. OBTP (Accession NM_017601) is another VGAM1183 host target gene. OBTP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OBTP, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBTP BINDING SITE, designated SEQ ID:19076, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42420] Another function of VGAM1183 is therefore inhibition of OBTP (Accession NM_017601). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBTP. Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463) is another VGAM1183 host target gene. PTP4A1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTP4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A1 BINDING SITE, designated SEQ ID:9530, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42421] Another function of VGAM1183 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 1

(PTP4A1, Accession NM_003463). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A1. RRN3 (Accession NM_018427) is another VGAM1183 host target gene. RRN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRN3 BINDING SITE, designated SEQ ID:20487, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42422] Another function of VGAM1183 is therefore inhibition of RRN3 (Accession NM_018427). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRN3. LOC150848 (Accession XM_097959) is another VGAM1183 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41256, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42423] Another function of VGAM1183 is therefore inhibition of LOC150848 (Accession XM_097959). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. LOC161734 (Accession XM_102109) is another VGAM1183 host target gene. LOC161734 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161734 BINDING SITE, designated SEQ ID:42110, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42424] Another function of VGAM1183 is therefore inhibition of LOC161734 (Accession XM_102109). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161734. LOC220930 (Accession XM_167624) is an-

other VGAM1183 host target gene. LOC220930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220930 BINDING SITE, designated SEQ ID:44734, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42425] Another function of VGAM1183 is therefore inhibition of LOC220930 (Accession XM_167624). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220930. LOC221663 (Accession XM_168131) is another VGAM1183 host target gene. LOC221663 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221663 BINDING SITE, designated SEQ ID:45038, to the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, also designated SEQ ID:3894.

[42426] Another function of VGAM1183 is therefore inhibition of LOC221663 (Accession XM_168131). Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221663. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1184 (VGAM1184) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42427] VGAM1184 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1184 was detected is described hereinabove with reference to Figs. 1–8.

[42428] VGAM1184 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cactus Virus X. VGAM1184 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42429] VGAM1184 gene encodes a VGAM1184 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1184 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1184 precursor RNA is designated SEQ ID:1170, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1170 is located at position 5274 relative to the genome of Cactus Virus X.

- [42430] VGAM1184 precursor RNA folds onto itself, forming VGAM1184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [42431] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1184 folded precursor RNA into VGAM1184 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1184 RNA is designated SEQ ID:3895, and is provided hereinbelow with reference to the sequence listing part.

[42432] VGAM1184 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1184 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42433] VGAM1184 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1184 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1184 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42434] The complementary binding of VGAM1184 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1184 host target RNA into VGAM1184 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42435] It is appreciated that VGAM1184 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1184 host target genes. The mRNA of each one of this plurality of VGAM1184 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1184 RNA, herein designated VGAM RNA, and which when bound by VGAM1184 RNA causes inhibition of translation of respective one or more VGAM1184 host target proteins.

[42436] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1184 gene, herein designated VGAM GENE, on one or more VGAM1184 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42437] It is yet further appreciated that a function of VGAM1184 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment of viral infection by Cactus Virus X. Specific functions, and accordingly utilities, of VGAM1184 correlate with, and may be deduced from, the identity of the host target genes which VGAM1184 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42438] Nucleotide sequences of the VGAM1184 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1184 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1184 are further described hereinbelow with reference to Table 1.

[42439] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1184 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1184 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[42440] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1184 gene, herein designated VGAM is inhibition of expression of VGAM1184 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1184 correlate with, and may be deduced from, the identity of the target genes which VGAM1184 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42441] Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_022973) is a VGAM1184 host target gene. FGFR2 BINDING SITE1 through FGFR2 BINDING SITE11 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR2 BINDING SITE1 through FGFR2 BINDING SITE11, designated SEQ ID:23246, SEQ ID:23248, SEQ ID:23239, SEQ ID:23249, SEQ ID:23295, SEQ ID:5639, SEQ ID:23235, SEQ ID:23242, SEQ ID:23247, SEQ ID:23289

and SEQ ID:23301 respectively, to the nucleotide sequence of VGAM1184 RNA, herein designated VGAM RNA, also designated SEQ ID:3895.

[42442] A function of VGAM1184 is therefore inhibition of Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_022973). Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR2. HSJ1 (Accession NM_006736) is another VGAM1184 host target gene. HSJ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSJ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSJ1 BINDING SITE, designated SEQ ID:13587, to the nucleotide sequence of VGAM1184 RNA, herein designated VGAM RNA, also designated SEQ ID:3895.

[42443] Another function of VGAM1184 is therefore inhibition of HSJ1 (Accession NM_006736). Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HSJ1. KIAA0802 (Accession XM_031357) is another VGAM1184 host target gene. KIAA0802 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0802 BINDING SITE, designated SEQ ID:31349, to the nucleotide sequence of VGAM1184 RNA, herein designated VGAM RNA, also designated SEQ ID:3895.

[42444] Another function of VGAM1184 is therefore inhibition of KIAA0802 (Accession XM_031357). Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0802. I(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM_114201) is another VGAM1184 host target gene. L3MBTL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by L3MBTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L3MBTL2 BINDING SITE, designated SEQ

ID:42789, to the nucleotide sequence of VGAM1184 RNA, herein designated VGAM RNA, also designated SEQ ID:3895.

[42445] Another function of VGAM1184 is therefore inhibition of I(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM_114201). Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL2. LAP1B (Accession XM_035429) is another VGAM1184 host target gene. LAP1B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LAP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAP1B BINDING SITE, designated SEQ ID:32261, to the nucleotide sequence of VGAM1184 RNA, herein designated VGAM RNA, also designated SEQ ID:3895.

[42446] Another function of VGAM1184 is therefore inhibition of LAP1B (Accession XM_035429). Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAP1B. Serine/threonine Kinase 38 Like (STK38L, Accession

XM_044823) is another VGAM1184 host target gene.

STK38L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34285, to the nucleotide sequence of VGAM1184 RNA, herein designated VGAM RNA, also designated SEQ ID:3895.

[42447] Another function of VGAM1184 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823). Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. LOC149182 (Accession XM_097605) is another VGAM1184 host target gene. LOC149182 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149182 BINDING SITE, designated SEQ ID:40967, to the nucleotide sequence of

VGAM1184 RNA, herein designated VGAM RNA, also designated SEQ ID:3895.

[42448] Another function of VGAM1184 is therefore inhibition of LOC149182 (Accession XM_097605). Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149182. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1185 (VGAM1185) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42449] VGAM1185 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1185 was detected is described hereinabove with reference to Figs. 1–8.

[42450] VGAM1185 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cactus Virus X.

VGAM1185 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42451] VGAM1185 gene encodes a VGAM1185 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1185 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1185 precursor RNA is designated SEQ ID:1171, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1171 is located at position 4689 relative to the genome of Cactus Virus X.

[42452] VGAM1185 precursor RNA folds onto itself, forming VGAM1185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42453] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1185 folded precursor RNA into VGAM1185 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1185 RNA is designated SEQ ID:3896, and is provided hereinbelow with reference to the sequence listing part.

[42454] VGAM1185 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1185 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42455] VGAM1185 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1185 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1185 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42456] The complementary binding of VGAM1185 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1185 host target RNA into VGAM1185 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42457] It is appreciated that VGAM1185 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1185 host target genes. The mRNA of each one of this plurality of VGAM1185 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1185 RNA, herein designated VGAM RNA, and which when bound by VGAM1185 RNA causes inhibition of translation of respective one or more VGAM1185 host target proteins.

[42458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1185 gene, herein designated VGAM GENE, on one or more VGAM1185 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[42459] It is yet further appreciated that a function of VGAM1185 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of viral infection by Cactus Virus X. Specific functions, and accordingly utilities, of VGAM1185 correlate with, and may be deduced from, the identity of the host target genes which VGAM1185 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42460] Nucleotide sequences of the VGAM1185 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1185 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1185 are further described hereinbelow with reference to Table 1.

[42461] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1185 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1185 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42462] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1185 gene, herein designated VGAM is inhibition of expression of VGAM1185 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1185 correlate with, and may be deduced from, the identity of the target genes which VGAM1185 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42463] Adducin 2 (beta) (ADD2, Accession NM_017482) is a VGAM1185 host target gene. ADD2 BINDING SITE1 through ADD2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADD2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE1 through ADD2 BINDING SITE3, designated SEQ ID:18933, SEQ ID:18938 and SEQ ID:18946 respectively, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42464] A function of VGAM1185 is therefore inhibition of Adducin 2 (beta) (ADD2, Accession NM_017482), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD2. The function of ADD2 has been established by previous studies. See alpha-adducin (ADD1; 102680). Adducin is a heterodimeric calmodulin (OMIM Ref. No. 114180)-binding protein of the cell-membrane skeleton, which is thought to play a role in assembly of the spectrin-actin lattice that underlies the plasma membrane (see OMIM Ref. No. also 182860 and 102560). Missense mutations in both the alpha- and beta-adducin genes that alter amino acids that are normally phosphorylated have been associated with the regulation of blood pressure in the Milan hypertensive strain (MHS) of rats (Bianchi et al., 1994). Muro et al. (2000) showed that in Add2 -/- mice, targeted disruption of the beta-adducin gene resulted in an 80% decrease of alpha-adducin and a 4-fold upregulation of gamma-adducin in erythrocytes. Elliptocytes, ovalocytes, and occasionally spherocytes were found in the blood smears of -/- mice. Mild hematologic findings were

thought to be related to the amount of adducin remaining in the mutant animals (presumably alpha-gamma adducin).

[42465] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42466] Bianchi, G.; Tripodi, G.; Casari, G.; Salardi, S.; Barber, B. R.; Garcia, R.; Leoni, P.; Torielli, L.; Cusi, D.; Ferrandi, M.; Pinna, L. A.; Baralle, F. E.; Ferrari, P. : Two point mutations within the adducin genes are involved in blood pressure variation. Proc. Nat. Acad. Sci. 91: 3999–4003, 1994. ; and

[42467] Muro, A. F.; Marro, M. L.; Gajovic, S.; Porro, F.; Luzzatto, L.; Baralle, F. E. : Mild spherocytic hereditary elliptocytosis and altered levels of alpha- and gamma-adducins in beta-adduc.

[42468] Further studies establishing the function and utilities of ADD2 are found in John Hopkins OMIM database record ID 102681, and in cited publications numbered 79 and 2791–488 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 7-dehydrocholesterol Reductase (DHCR7, Accession NM_001360) is another VGAM1185 host target gene.

DHCR7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DHCR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHCR7 BINDING SITE, designated SEQ ID:7040, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42469] Another function of VGAM1185 is therefore inhibition of 7-dehydrocholesterol Reductase (DHCR7, Accession NM_001360). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHCR7. Lysophospholipase I (LYPLA1, Accession NM_006330) is another VGAM1185 host target gene. LYPLA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LYPLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYPLA1 BINDING SITE, designated SEQ ID:13028, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3896.

[42470] Another function of VGAM1185 is therefore inhibition of Lysophospholipase I (LYPLA1, Accession NM_006330). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYPLA1. Matrix Metalloproteinase 19 (MMP19, Accession NM_002429) is another VGAM1185 host target gene. MMP19 BINDING SITE1 and MMP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MMP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE1 and MMP19 BINDING SITE2, designated SEQ ID:8268 and SEQ ID:23076 respectively, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42471] Another function of VGAM1185 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM_002429). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP19. Phosphoribosyl Pyrophosphate Amidotransferase (PPAT, Accession

NM_002703) is another VGAM1185 host target gene.

PPAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPAT BINDING SITE, designated SEQ ID:8550, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42472] Another function of VGAM1185 is therefore inhibition of Phosphoribosyl Pyrophosphate Amidotransferase (PPAT, Accession NM_002703). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPAT. Stathmin 1/oncoprotein 18 (STMN1, Accession NM_005563) is another VGAM1185 host target gene. STMN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STMN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STMN1 BINDING SITE, designated SEQ ID:12091, to the nucleotide sequence of VGAM1185 RNA,

herein designated VGAM RNA, also designated SEQ ID:3896.

[42473] Another function of VGAM1185 is therefore inhibition of Stathmin 1/oncoprotein 18 (STMN1, Accession NM_005563), a gene which prevents assembly and promotes disassembly of microtubules. Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STMN1. The function of STMN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM281. Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476) is another VGAM1185 host target gene. BTN2A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A1 BINDING SITE, designated SEQ ID:27803, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42474] Another function of VGAM1185 is therefore inhibition of

Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A1. Chloride Intracellular Channel 4 (CLIC4, Accession NM_013943) is another VGAM1185 host target gene. CLIC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLIC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC4 BINDING SITE, designated SEQ ID:15127, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42475] Another function of VGAM1185 is therefore inhibition of Chloride Intracellular Channel 4 (CLIC4, Accession NM_013943). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC4. FLJ12875 (Accession NM_024544) is another VGAM1185 host target gene. FLJ12875 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12875, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12875 BINDING SITE, designated SEQ ID:23755, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42476] Another function of VGAM1185 is therefore inhibition of FLJ12875 (Accession NM_024544). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12875. KIAA1052 (Accession NM_014956) is another VGAM1185 host target gene. KIAA1052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1052 BINDING SITE, designated SEQ ID:17312, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42477] Another function of VGAM1185 is therefore inhibition of KIAA1052 (Accession NM_014956). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1052. Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215) is another VGAM1185 host target gene. TGOLN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGOLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGOLN2 BINDING SITE, designated SEQ ID:32026, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42478] Another function of VGAM1185 is therefore inhibition of Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGOLN2. LOC113763 (Accession NM_138434) is another VGAM1185 host target gene. LOC113763 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC113763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC113763 BINDING SITE, designated SEQ ID:28801, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42479] Another function of VGAM1185 is therefore inhibition of LOC113763 (Accession NM_138434). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113763. LOC116113 (Accession XM_166413) is another VGAM1185 host target gene. LOC116113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116113 BINDING SITE, designated SEQ ID:44286, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42480] Another function of VGAM1185 is therefore inhibition of LOC116113 (Accession XM_166413). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116113. LOC124842 (Accession XM_064333) is an-

other VGAM1185 host target gene. LOC124842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124842 BINDING SITE, designated SEQ ID:37262, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42481] Another function of VGAM1185 is therefore inhibition of LOC124842 (Accession XM_064333). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124842. LOC149271 (Accession XM_086475) is another VGAM1185 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38679, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42482] Another function of VGAM1185 is therefore inhibition of LOC149271 (Accession XM_086475). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. LOC150271 (Accession XM_097859) is another VGAM1185 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41167, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42483] Another function of VGAM1185 is therefore inhibition of LOC150271 (Accession XM_097859). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC152573 (Accession XM_087488) is another VGAM1185 host target gene. LOC152573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152573, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152573 BINDING SITE, designated SEQ ID:39287, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42484] Another function of VGAM1185 is therefore inhibition of LOC152573 (Accession XM_087488). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152573. LOC158158 (Accession XM_088494) is another VGAM1185 host target gene. LOC158158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158158 BINDING SITE, designated SEQ ID:39734, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42485] Another function of VGAM1185 is therefore inhibition of LOC158158 (Accession XM_088494). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158158. LOC200860 (Accession XM_117289) is another VGAM1185 host target gene. LOC200860 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:43355, to the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, also designated SEQ ID:3896.

[42486] Another function of VGAM1185 is therefore inhibition of LOC200860 (Accession XM_117289). Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200860. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1186 (VGAM1186) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42487] VGAM1186 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1186 was detected is described hereinabove with reference to Figs. 1–8.

[42488] VGAM1186 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus C. VGAM1186 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42489] VGAM1186 gene encodes a VGAM1186 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1186 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1186 precursor RNA is designated SEQ ID:1172, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1172 is located at position 30647 relative to the genome of Human Adenovirus C.

[42490] VGAM1186 precursor RNA folds onto itself, forming VGAM1186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42491] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1186 folded precursor RNA into VGAM1186 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1186 RNA is designated SEQ ID:3897, and is provided hereinbelow with reference to the sequence listing part.

[42492] VGAM1186 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1186 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42493] VGAM1186 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1186 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1186 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[42494] The complementary binding of VGAM1186 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1186 host target RNA into VGAM1186 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42495] It is appreciated that VGAM1186 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1186 host target genes. The mRNA of each one of this plurality of VGAM1186 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1186 RNA, herein designated VGAM RNA, and which when bound by VGAM1186 RNA causes inhibition of translation of respective one or more VGAM1186 host target proteins.

[42496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1186 gene, herein designated VGAM GENE, on one or more VGAM1186 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42497] It is yet further appreciated that a function of VGAM1186 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of viral infection by Human Adenovirus C. Specific functions, and accordingly utilities, of VGAM1186 correlate with, and may be deduced from, the identity of the host target genes which VGAM1186 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42498] Nucleotide sequences of the VGAM1186 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1186 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1186 are further described hereinbelow with reference to Table 1.

[42499] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1186 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1186 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42500] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1186 gene, herein designated VGAM is inhibition of expression of VGAM1186 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1186 correlate with, and may be deduced from, the identity of the target genes which VGAM1186 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42501] Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM_096169) is a VGAM1186 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

INPP5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:40307, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42502] A function of VGAM1186 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM_096169), a gene which hydrolyzes Ins(1,3,4,5)P4 and PtdIns(3,4,5)P3; contains an SH2-domain. Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM64. Mastermind-like 1 (Drosophila) (MAML1, Accession NM_014757) is another VGAM1186 host target gene. MAML1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MAML1 BINDING SITE, designated SEQ ID:16500, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42503] Another function of VGAM1186 is therefore inhibition of Mastermind-like 1 (Drosophila) (MAML1, Accession NM_014757), a gene which MAML1 functions as a transcriptional coactivator for Notch signaling. Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAML1. The function of MAML1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM556. Transcription Factor Dp-1 (TFDP1, Accession NM_007111) is another VGAM1186 host target gene. TFDP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFDP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFDP1 BINDING SITE, designated SEQ ID:13978, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3897.

[42504] Another function of VGAM1186 is therefore inhibition of Transcription Factor Dp-1 (TFDP1, Accession NM_007111). Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFDP1. BRAG (Accession NM_014863) is another VGAM1186 host target gene. BRAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRAG BINDING SITE, designated SEQ ID:16941, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42505] Another function of VGAM1186 is therefore inhibition of BRAG (Accession NM_014863). Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRAG. KIAA0820 (Accession XM_044463) is another VGAM1186 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34221, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42506] Another function of VGAM1186 is therefore inhibition of KIAA0820 (Accession XM_044463). Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. KIAA0984 (Accession XM_037557) is another VGAM1186 host target gene. KIAA0984 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0984, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0984 BINDING SITE, designated SEQ ID:32646, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42507] Another function of VGAM1186 is therefore inhibition of KIAA0984 (Accession XM_037557). Accordingly, utilities of VGAM1186 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0984. KIAA1858 (Accession XM_040592) is another VGAM1186 host target gene. KIAA1858 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1858 BINDING SITE, designated SEQ ID:33331, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42508] Another function of VGAM1186 is therefore inhibition of KIAA1858 (Accession XM_040592). Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1858. Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM_006814) is another VGAM1186 host target gene. PSMF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMF1 BIND-

ING SITE, designated SEQ ID:13688, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42509] Another function of VGAM1186 is therefore inhibition of Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM_006814). Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMF1. LOC115129 (Accession XM_055292) is another VGAM1186 host target gene. LOC115129 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36256, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42510] Another function of VGAM1186 is therefore inhibition of LOC115129 (Accession XM_055292). Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. LOC255045 (Accession XM_171243) is an-

other VGAM1186 host target gene. LOC255045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255045 BINDING SITE, designated SEQ ID:46032, to the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, also designated SEQ ID:3897.

[42511] Another function of VGAM1186 is therefore inhibition of LOC255045 (Accession XM_171243). Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255045. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1187 (VGAM1187) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42512] VGAM1187 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1187 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[42513] VGAM1187 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus C. VGAM1187 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42514] VGAM1187 gene encodes a VGAM1187 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1187 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1187 precursor RNA is designated SEQ ID:1173, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1173 is located at position 26479 relative to the genome of Human Adenovirus C.

[42515] VGAM1187 precursor RNA folds onto itself, forming VGAM1187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42516] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1187 folded precursor RNA into VGAM1187 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1187 RNA is designated SEQ ID:3898, and is provided hereinbelow with reference to the sequence listing part.

[42517] VGAM1187 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1187 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1187 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42518] VGAM1187 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1187 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1187 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1187 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1187 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42519] The complementary binding of VGAM1187 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1187 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1187 host target RNA into VGAM1187 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42520] It is appreciated that VGAM1187 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1187 host target genes. The mRNA of each one of this plurality of VGAM1187 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1187 RNA, herein designated VGAM RNA, and which when bound by VGAM1187 RNA causes inhibition of translation of respective one or more VGAM1187 host target proteins.

[42521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1187 gene, herein designated VGAM GENE, on one or more VGAM1187 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42522] It is yet further appreciated that a function of VGAM1187 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of viral infection by Human Adenovirus C. Specific functions, and accordingly utilities, of VGAM1187 correlate with, and may be deduced from, the identity of the host target genes which VGAM1187 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42523] Nucleotide sequences of the VGAM1187 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1187 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1187 are further described hereinbelow with reference to Table 1.

[42524] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1187 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1187 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42525] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1187 gene, herein designated VGAM is inhibition of expression of VGAM1187 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1187 correlate with, and may be deduced from, the identity of the target genes which VGAM1187 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42526] Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719) is a VGAM1187 host target gene. CACNA1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CACNA1C, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA1C BINDING SITE, designated SEQ ID:6380, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42527] A function of VGAM1187 is therefore inhibition of Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719), a gene which is alpha-1 subunit of DHP-sensitive calcium channels from cardiac muscle and the brain. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1C. The function of CACNA1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM182. Calcium Channel, Voltage-dependent, Gamma Subunit 8 (CACNG8, Accession XM_050231) is another VGAM1187 host target gene. CACNG8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CACNG8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CACNG8 BINDING SITE, designated SEQ ID:35595, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42528] Another function of VGAM1187 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 8 (CACNG8, Accession XM_050231), a gene which may stabilize the calcium channel in an inactivated (closed) state. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG8. The function of CACNG8 has been established by previous studies. Voltage-dependent calcium channels couple membrane depolarization in a number of cellular processes. These activities are regulated by distinct channels composed of the pore-forming alpha-1 subunit (e.g., CACNA1D; 114206) and the modulatory beta (e.g., CACNB1; 114207), alpha-2/delta (e.g., CACNA2D1; 114204), and gamma (e.g., CACNG1; 114209) subunits. By database searching and analysis of BAC clones from chromosome 19 near the PRKCG gene (OMIM Ref. No. 176980), Burgess et al. (2001) identified cDNAs encoding CACNG6 (OMIM Ref. No.

606898), CACNG7 (OMIM Ref. No. 606899), and CACNG8. The deduced 414-amino acid CACNG8 protein contains 4 transmembrane segments, a highly conserved N-glycosylation site in the first extracellular loop, and, in its C terminus, conserved phosphorylation sites and a consensus target for binding by PDZ domain proteins. Burgess et al. (2001) noted that CACNG8 may contain additional N-terminal amino acids. RT-PCR analysis of 24 adult and fetal tissues detected highest expression of CACNG8 in adult and fetal brain, followed by testis, spinal cord, and mammary.

[42529] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42530] Burgess, D. L.; Gefrides, L. A.; Foreman, P. J.; Noebels, J. L. : A cluster of three novel Ca(2+) channel gamma subunit genes on chromosome 19q13.4: evolution and expression profile of the gamma subunit gene family. *Genomics* 71: 339-350, 2001. ; and

[42531] Chu, P.-J.; Robertson, H. M.; Best, P. M. : Calcium channel gamma subunits provide insights into the evolution of this gene family. *Gene* 280: 37-48, 2001.

[42532] Further studies establishing the function and utilities of

CACNG8 are found in John Hopkins OMIM database record ID 606900, and in cited publications numbered 4526–4527 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EGF-like-domain, Multiple 3 (EGFL3, Accession XM_031401) is another VGAM1187 host target gene. EGFL3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL3 BINDING SITE, designated SEQ ID:31374, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42533] Another function of VGAM1187 is therefore inhibition of EGF-like-domain, Multiple 3 (EGFL3, Accession XM_031401). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL3. Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_015850) is another VGAM1187 host target gene. FGFR1 BINDING SITE1

through FGFR1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 through FGFR1 BINDING SITE3, designated SEQ ID:17976, SEQ ID:23370 and SEQ ID:6205 respectively, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42534] Another function of VGAM1187 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_015850). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM_000844) is another VGAM1187 host target gene. GRM7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GRM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM7 BINDING SITE,

designated SEQ ID:6517, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42535] Another function of VGAM1187 is therefore inhibition of Glutamate Receptor, Metabotropic 7 (GRM7, Accession NM_000844), a gene which is mediated by a g-protein that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM7. The function of GRM7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM746. Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326) is another VGAM1187 host target gene. MAPRE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:14711, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42536] Another function of VGAM1187 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326), a gene which interact with cytoplasmic microtubules, and with the adenomatous polyposis coli. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3. The function of MAPRE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. Mannose-P-dolichol Utilization Defect 1 (MPDU1, Accession NM_004870) is another VGAM1187 host target gene. MPDU1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPDU1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPDU1 BINDING SITE, designated SEQ ID:11297, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42537] Another function of VGAM1187 is therefore inhibition of Mannose-P-dolichol Utilization Defect 1 (MPDU1, Acces-

sion NM_004870), a gene which corrects the Lec15 mutant phenotype. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPDU1. The function of MPDU1 has been established by previous studies. MPD synthase (DPM1; 603503) catalyzes the synthesis of manose-P-dolichol (MPD), an essential sugar donor for glycoconjugates and an essential substrate for synthesis of glycosylphosphatidylinositols (GPIs). The Chinese hamster ovary (CHO) Lec15 and Lec35 mutant cells are defective in synthesis and utilization, respectively, of MPD. Using an expression cloning strategy, Ware and Lehrman (1996) isolated SL15 (suppressor of Lec15), a CHO cDNA that efficiently corrected the Lec15 phenotype. The SL15 cDNA also suppressed the Lec35 mutation. Sequence analysis indicated that SL15 encodes a transmembrane protein with cytosolic C and N termini. There was no significant sequence similarity between SL15 and the *S. cerevisiae* MPD synthase, leading the authors to suggest that SL15 plays a distinct role in MPD synthesis. See also DPM2 (OMIM Ref. No. 603564). Mao et al. (1998) identified an umbilical cord blood CD34-positive cell cDNA encoding the human homolog of SL15. The predicted human pro-

tein contains 247 amino acids

[42538] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42539] Mao, M.; Fu, G.; Wu, J.-S.; Zhang, Q.-H.; Zhou, J.; Kan, L.-X.; Huang, Q.-H.; He, K.-L.; Gu, B.-W.; Han, Z.-G.; Shen, Y.; Gu, J.; Yu, Y.-P.; Xu, S.-H.; Wang, Y.-X.; Chen, S.-J.; Chen, Z. : Identification of genes expressed in human CD34+ hematopoietic stem/progenitor cells by expressed sequence tags and efficient full-length cDNA cloning. Proc. Nat. Acad. Sci. 95: 8175-8180, 1998. ; and

[42540] Ware, F. E.; Lehrman, M. A. : Expression cloning of a novel suppressor of the Lec15 and Lec35 glycosylation mutations of Chinese hamster ovary cells. J. Biol. Chem. 271: 13935-13938, 1996.

[42541] Further studies establishing the function and utilities of MPDU1 are found in John Hopkins OMIM database record ID 604041, and in cited publications numbered 8801 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurexin 1 (NRXN1, Accession NM_138735) is another VGAM1187 host target gene. NRXN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

NRXN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN1 BINDING SITE, designated SEQ ID:28994, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42542] Another function of VGAM1187 is therefore inhibition of Neurexin 1 (NRXN1, Accession NM_138735), a gene which may be involved in cell recognition, cell adhesion, and mediate intracellular signaling. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN1. The function of NRXN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Plexin B2 (PLXNB2, Accession NM_012401) is another VGAM1187 host target gene. PLXNB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLXNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

PLXNB2 BINDING SITE, designated SEQ ID:14776, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42543] Another function of VGAM1187 is therefore inhibition of Plexin B2 (PLXNB2, Accession NM_012401), a gene which is a novel member of the plexin family. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNB2. The function of PLXNB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM87. Parathymosin (PTMS, Accession NM_002824) is another VGAM1187 host target gene. PTMS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTMS BINDING SITE, designated SEQ ID:8695, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42544] Another function of VGAM1187 is therefore inhibition of Parathymosin (PTMS, Accession NM_002824), a gene

which is involved in the regulation of cellular immunity. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTMS. The function of PTMS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM_003036) is another VGAM1187 host target gene. SKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKI BINDING SITE, designated SEQ ID:8987, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42545] Another function of VGAM1187 is therefore inhibition of V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM_003036). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKI. Sequestosome 1 (SQSTM1, Accession NM_003900) is another VGAM1187

host target gene. SQSTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SQSTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SQSTM1 BINDING SITE, designated SEQ ID:9989, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42546] Another function of VGAM1187 is therefore inhibition of Sequestosome 1 (SQSTM1, Accession NM_003900), a gene which binds SH2 domain of p56lck and ubiquitin, and it is associated with a serine/threonine kinase activity. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SQSTM1. The function of SQSTM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM824.TR2 (Accession XM_051264) is another VGAM1187 host target gene. TR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TR2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TR2 BINDING SITE, designated SEQ ID:35794, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42547] Another function of VGAM1187 is therefore inhibition of TR2 (Accession XM_051264), a gene which maintains high levels of reduced glutathione in the cytosol (by similarity). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TR2. The function of TR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM_012479) is another VGAM1187 host target gene. YWHAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAG BINDING SITE, designated SEQ

ID:14858, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42548] Another function of VGAM1187 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM_012479), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAG. The function of YWHAG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Cyclin E1 (CCNE1, Accession NM_001238) is another VGAM1187 host target gene. CCNE1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CCNE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNE1 BINDING SITE, designated SEQ ID:6906, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3898.

[42549] Another function of VGAM1187 is therefore inhibition of Cyclin E1 (CCNE1, Accession NM_001238). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNE1. CEP3 (Accession NM_006449) is another VGAM1187 host target gene. CEP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CEP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP3 BINDING SITE, designated SEQ ID:13156, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42550] Another function of VGAM1187 is therefore inhibition of CEP3 (Accession NM_006449). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP3. FLJ14525 (Accession NM_032800) is another VGAM1187 host target gene. FLJ14525 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14525, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14525 BINDING SITE, designated SEQ ID:26549, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42551] Another function of VGAM1187 is therefore inhibition of FLJ14525 (Accession NM_032800). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14525. FLJ20507 (Accession NM_017849) is another VGAM1187 host target gene. FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20507, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2, designated SEQ ID:19512 and SEQ ID:30220 respectively, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42552] Another function of VGAM1187 is therefore inhibition of

FLJ20507 (Accession NM_017849). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507. KIAA0669 (Accession NM_014779) is another VGAM1187 host target gene. KIAA0669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0669 BINDING SITE, designated SEQ ID:16625, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42553] Another function of VGAM1187 is therefore inhibition of KIAA0669 (Accession NM_014779). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0669. KIAA0997 (Accession NM_014950) is another VGAM1187 host target gene. KIAA0997 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0997 BINDING SITE, designated SEQ ID:17279, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42554] Another function of VGAM1187 is therefore inhibition of KIAA0997 (Accession NM_014950). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0997. MACMARCKS (Accession NM_023009) is another VGAM1187 host target gene. MACMARCKS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MACMARCKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACMARCKS BINDING SITE, designated SEQ ID:23271, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42555] Another function of VGAM1187 is therefore inhibition of MACMARCKS (Accession NM_023009). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACMARCKS. MGC10966 (Accession NM_031471) is

another VGAM1187 host target gene. MGC10966 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC10966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10966 BINDING SITE, designated SEQ ID:25537, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42556] Another function of VGAM1187 is therefore inhibition of MGC10966 (Accession NM_031471). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10966. Ornithine Decarboxylase Antizyme Inhibitor (OAZIN, Accession NM_015878) is another VGAM1187 host target gene. OAZIN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OAZIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZIN BINDING SITE, designated SEQ ID:18020, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3898.

[42557] Another function of VGAM1187 is therefore inhibition of Ornithine Decarboxylase Antizyme Inhibitor (OAZIN, Accession NM_015878). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZIN. Polymerase (RNA) III (DNA directed) Polypeptide F, 39 KDa (POLR3F, Accession XM_009639) is another VGAM1187 host target gene. POLR3F BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by POLR3F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLR3F BINDING SITE, designated SEQ ID:30115, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42558] Another function of VGAM1187 is therefore inhibition of Polymerase (RNA) III (DNA directed) Polypeptide F, 39 KDa (POLR3F, Accession XM_009639). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLR3F. Ring Finger Protein 10 (RNF10, Accession

NM_014868) is another VGAM1187 host target gene.

RNF10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RNF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF10 BINDING SITE, designated SEQ ID:16962, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42559] Another function of VGAM1187 is therefore inhibition of Ring Finger Protein 10 (RNF10, Accession NM_014868). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF10. Serine (or cysteine) Proteinase Inhibitor, Clade A (alpha-1 antiproteinase, antitrypsin), Member 1 (SERPINA1, Accession NM_000295) is another VGAM1187 host target gene. SERPINA1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SERPINA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SERPINA1 BINDING SITE, designated SEQ ID:5839, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42560] Another function of VGAM1187 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade A (alpha-1 antiproteinase, antitrypsin), Member 1 (SERPINA1, Accession NM_000295). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINA1. Torsin Family 2, Member A (TOR2A, Accession NM_130459) is another VGAM1187 host target gene. TOR2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOR2A BINDING SITE, designated SEQ ID:28220, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42561] Another function of VGAM1187 is therefore inhibition of Torsin Family 2, Member A (TOR2A, Accession NM_130459). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with TOR2A. LOC157226 (Accession XM_033876) is another VGAM1187 host target gene. LOC157226 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157226 BINDING SITE, designated SEQ ID:31976, to the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42562] Another function of VGAM1187 is therefore inhibition of LOC157226 (Accession XM_033876). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157226. LOC158373 (Accession XM_048539) is another VGAM1187 host target gene. LOC158373 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158373 BINDING SITE, designated SEQ ID:35190, to

the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, also designated SEQ ID:3898.

[42563] Another function of VGAM1187 is therefore inhibition of LOC158373 (Accession XM_048539). Accordingly, utilities of VGAM1187 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158373. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1188 (VGAM1188) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42564] VGAM1188 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1188 was detected is described hereinabove with reference to Figs. 1–8.

[42565] VGAM1188 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus C. VGAM1188 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42566] VGAM1188 gene encodes a VGAM1188 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1188 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1188 precursor RNA is designated SEQ ID:1174, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1174 is located at position 27647 relative to the genome of Human Adenovirus C.

[42567] VGAM1188 precursor RNA folds onto itself, forming VGAM1188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42568] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1188 folded precursor RNA into VGAM1188 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1188 RNA is designated SEQ ID:3899, and is provided hereinbelow with reference to the sequence listing part.

[42569] VGAM1188 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1188 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42570] VGAM1188 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1188 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1188 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42571] The complementary binding of VGAM1188 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1188 host target RNA into VGAM1188 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42572] It is appreciated that VGAM1188 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1188 host target genes. The mRNA of each one of this plurality of VGAM1188 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1188 RNA, herein designated VGAM RNA, and which when bound by VGAM1188 RNA causes inhibition of translation of respective one or more VGAM1188 host target proteins.

[42573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1188 gene, herein designated VGAM GENE, on one or more VGAM1188 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[42574] It is yet further appreciated that a function of VGAM1188 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of viral infection by Human Adenovirus C. Specific functions, and accordingly utilities, of VGAM1188 correlate with, and may be deduced from, the identity of the host target genes which VGAM1188 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42575] Nucleotide sequences of the VGAM1188 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1188 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1188 are further described hereinbelow with reference to Table 1.

[42576] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1188 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1188 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42577] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1188 gene, herein designated VGAM is inhibition of expression of VGAM1188 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1188 correlate with, and may be deduced from, the identity of the target genes which VGAM1188 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42578] Dual Oxidase 1 (DUOX1, Accession NM_017434) is a VGAM1188 host target gene. DUOX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DUOX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUOX1 BINDING SITE, designated SEQ ID:18889, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42579] A function of VGAM1188 is therefore inhibition of Dual Oxidase 1 (DUOX1, Accession NM_017434), a gene which

is a component of the thyroid hydrogen peroxide generating system. Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUOX1. The function of DUOX1 has been established by previous studies. Using a probe for a leukocyte NADPH oxidase, De Deken et al. (2000) cloned a full-length DUOX1 cDNA from a primary human thyroid cell cDNA library. The deduced 1,551-amino acid protein has a calculated molecular mass of 177 kD. It contains several domains characteristic of flavoproteins including NADPH- and FAD-binding domains, and 4 specific histidines and a conserved arginine predicted to bind a heme prosthetic group. DUOX2 also contains 2 EF-hand motifs, 4 putative N-glycosylation sites, and 7 hydrophobic stretches. It shares 83% and 53% sequence similarity with DUOX2 and gp91-phox (OMIM Ref. No. 306400), respectively, and significant similarity to other NADPH oxidases. DUOX1 and DUOX2 share 53% and 61% sequence similarity, respectively, with a predicted protein in *C. elegans*. Northern blot analysis detected expression of a 5.7-kb DUOX1 transcript in cultured human thymocytes. Immunolocalization studies demonstrated that DUOX1 colocalizes with thyroperoxidase at the

supranuclear apical pole of all thyroid cells. De Deken et al. (2000) detected upregulated expression of DUOX1 and DUOX2 mRNA in cultured human thymocytes stimulated with cAMP agonists. In a study of thyroid carcinomas, Lacroix et al. (2001) showed that levels of DUOX1 and DUOX2 were maintained in parallel and were more frequently seen in neoplastic tissues expressing other thyroid differentiation markers.

[42580] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42581] De Deken, X.; Wang, D.; Many, M.-C.; Costagliola, S.; Libert, F.; Vassart, G.; Dumont, J. E.; Miot, F. : Cloning of two human thyroid cDNAs encoding new members of the NADPH oxidase family. J. Biol. Chem. 275: 23227-23233, 2000. ; and

[42582] Lacroix, L.; Nocera, M.; Mian, C.; Caillou, B.; Virion, A.; Dupuy, C.; Filetti, S.; Bidart, J. M.; Schlumberger, M. : Expression of nicotinamide adenine dinucleotide phosphate oxidase.

[42583] Further studies establishing the function and utilities of DUOX1 are found in John Hopkins OMIM database record ID 606758, and in cited publications numbered

5570–5571 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phospholipase C, Beta 2 (PLCB2, Accession NM_004573) is another VGAM1188 host target gene. PLCB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLCB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLCB2 BINDING SITE, designated SEQ ID:10917, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42584] Another function of VGAM1188 is therefore inhibition of Phospholipase C, Beta 2 (PLCB2, Accession NM_004573), a gene which is the beta 2 subunit of phospholipase C. Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLCB2. The function of PLCB2 has been established by previous studies. Phosphoinositide-specific phospholipase C (PLC) plays a major role in transmembrane signaling by catalyzing the hydrolysis of phosphatidylinositol 4,5-bisphosphate (PIP2) and thereby gen-

erating the second messenger molecules inositol 1,4,5-trisphosphate (IP3) and diacylglycerol. Several distinct PLC enzymes have been identified in a variety of mammalian tissues. Park et al. (1992) isolated cDNAs encoding a previously uncharacterized PLC by screening a human cDNA library derived from the promyelocytic cell line HL-60 with a bovine PLC-beta-1 (PLCB1) cDNA. The 1,181-amino acid protein predicted from the human cDNAs shares 48% amino acid identity with rat Plcb1 and is similar in overall structure to Plcb1; thus, it was named PLC-beta-2 (PLCB2). PLCB2 and Plcb1 show the least sequence similarity in their C-terminal 450 amino acids. PLCB2 contains the X and Y regions conserved among PLCs, and 1 PEST sequence, a motif suggesting sensitivity of PLCB2 to proteases. Recombinant PLCB2 expressed in mammalian cells migrated as a 140-kD protein in SDS-polyacrylamide gels. Characterization of recombinant PLCB2 revealed that the catalytic activity of PLCB2 is dependent on calcium and that PLCB2 prefers phosphatidylinositol 4,5-bisphosphate to phosphatidylinositol as a substrate. Reconstitution experiments showed that alpha-q (OMIM Ref. No. 600998), which is the alpha subunit of the pertussis toxin-insensitive G protein, activates Plcb1

but not PLCB2, suggesting that receptor-dependent stimulation of these 2 PLCBs may require different G protein alpha subunits. By Southern blot analysis of a human/rodent somatic cell hybrid panel, Park et al. (1998) mapped the PLCB2 gene to chromosome 15. They localized the PLCB2 gene to 15q15 using FISH. Animal model experiments lend further support to the function of PLCB2. Li et al. (2000) described the phenotype of mice lacking Plcb2 and Plcb3 (OMIM Ref. No. 600230). The mice developed spontaneous multifocal skin ulcers usually starting at the age of 6 months or older. The lesions were localized mainly behind ears or on the neck, but sometimes also appeared on the face. The phenotype was similar to that of mice lacking Plcb3 alone.

[42585] It is appreciated that the abovementioned animal model for PLCB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[42586] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42587] Park, D.; Jhon, D.-Y.; Kriz, R.; Knopf, J.; Rhee, S. G. : Cloning, sequencing, expression, and Gq-independent

activation of phospholipase C-beta-2. J. Biol. Chem. 267: 16048-16055, 1992. ; and

[42588] Li, Z.; Jiang, H.; Xie, W.; Zhang, Z.; Smrcka, A. V.; Wu, D. : Roles of PLC-beta-2 and -beta-3 and PI3K-gamma in chemoattractant-mediated signal transduction. Science 287: 1046-1049, 200.

[42589] Further studies establishing the function and utilities of PLCB2 are found in John Hopkins OMIM database record ID 604114, and in cited publications numbered 7429, 7864-7433, 283 and 7434 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DNA Cross-link Repair 1A (PSO2 homolog, S. cerevisiae) (DCLRE1A, Accession XM_044815) is another VGAM1188 host target gene. DCLRE1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCLRE1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCLRE1A BINDING SITE, designated SEQ ID:34281, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42590] Another function of VGAM1188 is therefore inhibition of

DNA Cross-link Repair 1A (PSO2 homolog, *S. cerevisiae*) (DCLRE1A, Accession XM_044815). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCLRE1A. FLJ22419 (Accession NM_024697) is another VGAM1188 host target gene. FLJ22419 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22419, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22419 BINDING SITE, designated SEQ ID:24008, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42591] Another function of VGAM1188 is therefore inhibition of FLJ22419 (Accession NM_024697). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22419. KIAA0930 (Accession XM_047214) is another VGAM1188 host target gene. KIAA0930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0930, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0930 BINDING SITE, designated SEQ ID:34915, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42592] Another function of VGAM1188 is therefore inhibition of KIAA0930 (Accession XM_047214). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0930. MGC35558 (Accession NM_145013) is another VGAM1188 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29619, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42593] Another function of VGAM1188 is therefore inhibition of MGC35558 (Accession NM_145013). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC35558. PHRET1 (Accession NM_021200) is another VGAM1188 host target gene. PHRET1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHRET1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHRET1 BINDING SITE, designated SEQ ID:22175, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42594] Another function of VGAM1188 is therefore inhibition of PHRET1 (Accession NM_021200). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHRET1. RIG-I (Accession NM_014314) is another VGAM1188 host target gene. RIG-I BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RIG-I, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIG-I BINDING SITE, designated SEQ ID:15614, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3899.

[42595] Another function of VGAM1188 is therefore inhibition of RIG-I (Accession NM_014314). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIG-I. Williams Beuren Syndrome Chromosome Region 20A (WBSCR20A, Accession NM_032158) is another VGAM1188 host target gene. WBSCR20A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WBSCR20A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR20A BINDING SITE, designated SEQ ID:25860, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42596] Another function of VGAM1188 is therefore inhibition of Williams Beuren Syndrome Chromosome Region 20A (WBSCR20A, Accession NM_032158). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR20A. LOC144600 (Accession XM_096639) is another VGAM1188 host target gene. LOC144600 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144600 BINDING SITE, designated SEQ ID:40447, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42597] Another function of VGAM1188 is therefore inhibition of LOC144600 (Accession XM_096639). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144600. LOC150622 (Accession XM_086960) is another VGAM1188 host target gene. LOC150622 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150622 BINDING SITE, designated SEQ ID:38997, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42598] Another function of VGAM1188 is therefore inhibition of

LOC150622 (Accession XM_086960). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150622. LOC204285 (Accession XM_115292) is another VGAM1188 host target gene. LOC204285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204285 BINDING SITE, designated SEQ ID:43090, to the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, also designated SEQ ID:3899.

[42599] Another function of VGAM1188 is therefore inhibition of LOC204285 (Accession XM_115292). Accordingly, utilities of VGAM1188 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204285. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1189 (VGAM1189) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[42600] VGAM1189 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1189 was detected is described hereinabove with reference to Figs. 1–8.

[42601] VGAM1189 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Botrytis Virus F. VGAM1189 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42602] VGAM1189 gene encodes a VGAM1189 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1189 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1189 precursor RNA is designated SEQ ID:1175, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1175 is located at position 2597 relative to the genome of Botrytis Virus F.

[42603] VGAM1189 precursor RNA folds onto itself, forming VGAM1189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42604] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1189 folded precursor RNA into VGAM1189 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1189 RNA is designated SEQ ID:3900, and is provided hereinbelow with reference to the sequence listing part.

[42605] VGAM1189 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1189 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[42606] VGAM1189 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1189 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1189 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[42607] The complementary binding of VGAM1189 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1189 host target RNA into VGAM1189 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42608] It is appreciated that VGAM1189 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1189 host target genes. The mRNA of each one of this plurality of VGAM1189 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1189 RNA, herein designated VGAM RNA, and which when bound by VGAM1189 RNA causes inhibition of translation of respective one or more VGAM1189 host target proteins.

[42609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1189 gene, herein designated VGAM GENE, on one

or more VGAM1189 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42610] It is yet further appreciated that a function of VGAM1189 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of viral infection by Botrytis Virus F. Specific functions, and accordingly utilities, of VGAM1189 correlate with, and may be deduced from, the identity of the host target genes which VGAM1189 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42611] Nucleotide sequences of the VGAM1189 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1189 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1189 are further described hereinbelow with reference to Table 1.

[42612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1189 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1189 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42613] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1189 gene, herein designated VGAM is inhibition of expression of VGAM1189 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1189 correlate with, and may be deduced from, the identity of the target genes which VGAM1189 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42614] Acid Phosphatase 1, Soluble (ACP1, Accession

NM_004300) is a VGAM1189 host target gene. ACP1 BINDING SITE1 and ACP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACP1 BINDING SITE1 and ACP1 BINDING SITE2, designated SEQ ID:10508 and SEQ ID:13958 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42615] A function of VGAM1189 is therefore inhibition of Acid Phosphatase 1, Soluble (ACP1, Accession NM_004300), a gene which as demonstrated in starch-gel electrophoresis. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP1. The function of ACP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. A Disintegrin and Metalloproteinase Domain 11 (ADAM11, Accession NM_002390) is another VGAM1189 host target gene. ADAM11 BINDING SITE1 and ADAM11 BINDING SITE2 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAM11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM11 BINDING SITE1 and ADAM11 BINDING SITE2, designated SEQ ID:8207 and SEQ ID:38533 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42616] Another function of VGAM1189 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 11 (ADAM11, Accession NM_002390), a gene which Member of the ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM11. The function of ADAM11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM387.B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707) is another VGAM1189 host target gene. BCL7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7B, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7B BINDING SITE, designated SEQ ID:7435, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42617] Another function of VGAM1189 is therefore inhibition of B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707), a gene which is of yet unknown function. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7B. The function of BCL7B has been established by previous studies. Meng et al. (1998) constructed a physical map encompassing the 1.5-Mb region of chromosome 7q11.23 that is commonly deleted in Williams-Beuren syndrome (WBS; 194050). They identified 3 genes within this region, including BCL7B, which contains 6 exons. By EST database searching, screening of a liver cDNA library, and sequencing, they cloned a BCL7B cDNA encoding a deduced 202-amino acid protein that shows high homology to the BCL7A gene (OMIM Ref. No. 601406), which was cloned from a complex chromosomal translocation in Burkitt lymphoma cell lines. BCL7B is

highly conserved from *C. elegans* to human, suggesting that it has been conserved through evolution.

[42618] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42619] Jadayel, D. M.; Osborne, L. R.; Coignet, L. J. A.; Zani, V. J.; Tsui, L.-C.; Scherer, S. W.; Dyer, M. J. S. : The BCL7 gene family: deletion of BCL7B in Williams syndrome. *Gene* 224: 35–44, 1998. ; and

[42620] Meng, X.; Lu, X.; Li, Z.; Green, E. D.; Massa, H.; Trask, B. J.; Morris, C. A.; Keating, M. T. : Complete physical map of the common deletion region in Williams syndrome and identificat.

[42621] Further studies establishing the function and utilities of BCL7B are found in John Hopkins OMIM database record ID 605846, and in cited publications numbered 7187 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Bone Morpho-genetic Protein 1 (BMP1, Accession NM_006131) is another VGAM1189 host target gene. BMP1 BINDING SITE1 and BMP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BMP1, corresponding to HOST TARGET binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP1 BINDING SITE1 and BMP1 BINDING SITE2, designated SEQ ID:12769 and SEQ ID:12772 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42622] Another function of VGAM1189 is therefore inhibition of Bone Morphogenetic Protein 1 (BMP1, Accession NM_006131), a gene which cleaves procollagens leading to formation of extracellular matrix. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP1. The function of BMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Carnitine Acetyltransferase (CRAT, Accession NM_000755) is another VGAM1189 host target gene. CRAT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRAT BINDING SITE, designated SEQ ID:6406,

to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42623] Another function of VGAM1189 is therefore inhibition of Carnitine Acetyltransferase (CRAT, Accession NM_000755), a gene which catalyzes the reversible transfer of acyl groups from an acyl-CoA thioester to carnitine. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRAT. The function of CRAT has been established by previous studies. Carnitine acyltransferases are a group of enzymes that catalyze the reversible transfer of acyl groups from an acyl-CoA thioester to carnitine, thus forming the corresponding acylcarnitine. These enzymes can be distinguished according to their substrate specificity in carnitine palmitoyltransferase (see OMIM Ref. No. CPT1, 600528 and CPT2, 600650), carnitine octanoyltransferase (CROT; 606090), and carnitine acetyltransferase (EC 2.3.1.7). CRAT is a key enzyme for metabolic pathways involved with the control of the acyl-CoA/CoA ratio in mitochondria, peroxisomes, and endoplasmic reticulum Acetylcarnitine, which can be a precursor for acetylcholine synthesis catalyzed by choline acetyltransferase, is thought to

slow the rate of mental deterioration in Alzheimer patients, and Kalaria and Harik (1992) found decreased function of CRAT in the brain of Alzheimer patients

[42624] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42625] Kalaria, R. N.; Harik, S. I. : Carnitine acetyltransferase activity in the human brain and its microvessels is decreased in Alzheimer's disease. *Ann. Neurol.* 32: 583–586, 1992. ; and

[42626] van der Leij, F. R.; Huijkman, N. C. A.; Boomsma, C.; Kuipers, J. R. G.; Bartelds, B. : Genomics of the human carnitine acyltransferase genes. *Molec. Genet. Metab.* 71: 139–153, 2000.

[42627] Further studies establishing the function and utilities of CRAT are found in John Hopkins OMIM database record ID 600184, and in cited publications numbered 7744–7746 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytoplasmic Linker 2 (CYLN2, Accession NM_003388) is another VGAM1189 host target gene. CYLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYLN2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLN2 BINDING SITE, designated SEQ ID:9422, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42628] Another function of VGAM1189 is therefore inhibition of Cytoplasmic Linker 2 (CYLN2, Accession NM_003388), a gene which associates with microtubules and dendritic lamellar bodies. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLN2. The function of CYLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM94. Dopamine Beta-hydroxylase (dopamine beta-monooxygenase) (DBH, Accession NM_000787) is another VGAM1189 host target gene. DBH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DBH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBH BINDING SITE, desig-

nated SEQ ID:6439, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42629] Another function of VGAM1189 is therefore inhibition of Dopamine Beta-hydroxylase (dopamine beta-monooxygenase) (DBH, Accession NM_000787), a gene which converts dopamine to norepinephrine . Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBH. The function of DBH has been established by previous studies. Dopamine beta-hydroxylase (DBH; EC 1.14.17.1), the enzyme that converts dopamine to norepinephrine, is present in the synaptic vesicles of postganglionic sympathetic neurons. Release of norepinephrine is accompanied by the simultaneous release of DBH. For this reason, it has been proposed that plasma DBH may serve as an index of sympathetic activity. Schanberg et al. (1974) found that subjects showed a wide range of values with a 'low' group and a 'high' group. The high group tended to show higher and less stable levels of blood pressure. In a twin study, Ross et al. (1973) found a higher concordance for level of DBH activity in monozygotic twins than in dizygotic twins. Ogiwara et al. (1975)

did not find a bimodal distribution for serum DBH in the population. However, highly significant correlations were found for the serum DBH of sib-sib pairs and mean parent-child pairs. No significant correlation was found for father-mother pairs. Weinshilboum et al. (1975) concluded that low serum dopamine beta-hydroxylase is recessive. Gershon and Goldin (1981) concluded that the family data are consistent with codominant inheritance. Possible linkage of DBH to ABO on chromosome 9 was indicated by a maximum lod score of 1.82 at 0.0 and 10% recombination fractions for males and females, respectively (Goldin et al., 1982). Elston et al. (1979) found a lod score of 2.32 at 0% recombination, giving a combined score of 2.32. Asamoah et al. (1987) studied DBH levels and polymorphic markers in 178 members of a family ascertained through 6 members who had myocardial infarction. The persons with infarction had lower levels of DBH than did others, 'but this difference was partly confounded with age differences.' Segregation analysis suggested that a codominant gene for DBH was segregating in the family. The largest lod score yielded by linkage analysis was 0.53 with ABO at 20% recombination. Adding this to the lod scores obtained by Elston et al. (1979) and

Goldin et al. (1982), they obtained combined lod scores of 2.49 and 2.50 at 0.0 and 10% recombination, respectively. Wilson et al. (1987, 1988) arrived at a lod score of 5.88 at a recombination fraction of 0.0 for the linkage of DBH and ABO. The DBH gene was not polymorphic in a black family. In studies using RFLPs of the DBH gene, Perry et al. (1991) found no recombination with argininosuccinate synthetase (OMIM Ref. No. 603470) and ABO blood group loci, with lod scores of 7.37 and 4.5, respectively, at $\theta = 0.0$. Using the full-length cDNA clone isolated by Lamouroux et al. (1987) from a human pheochromocytoma lambda library, Craig et al. (1988) showed by in situ hybridization that the DBH gene is located on 9q34. Pilz et al. (1992) used interspecies backcrosses to map the Dbh gene to mouse chromosome 2. Robertson et al. (1986) described a patient who appeared to have an isolated defect in the beta-hydroxylation of dopamine in peripheral nerves; see 146500. Man in't Veld et al. (1987) described a similar case in a 21-year-old woman with severe orthostatic hypotension. Ptosis, skeletal muscle hypotonia, and recurrent hypoglycemia had been noticed from early childhood. There was virtually complete loss of noradrenergic innervation but intact cholinergic function. Nora-

drenaline and adrenaline were not detectable in plasma, urine, and cerebrospinal fluid, but dopamine was 7- to 12-fold normal in plasma, 4-fold normal in urine, and 20-fold normal in CSF. Measurements of catecholamine metabolites showed further evidence for impairment of noradrenaline and adrenaline biosynthesis due to deficient dopamine beta-hydroxylation. Dopamine beta-hydroxylase was undetectable in plasma and CSF. Physiologic and pharmacologic stimuli of sympathetic neurotransmitter release caused increases in plasma dopamine rather than in plasma noradrenaline. The syndrome seemed to be caused by congenital dopamine beta-hydroxylase deficiency. There were no other affected individuals in the family, the parents were unrelated, and 2 sibs were in good health. As useful controls, 12 other patients with orthostatic hypotension, either idiopathic or due to other causes such as hereditary amyloidosis, primary amyloidosis, diabetic neuropathy, Shy-Drager syndrome, amyloidosis with multiple myeloma, were studied and found to have normal levels of dopamine in the plasma. Biaggioni and Robertson (1987) found remarkable improvement from administration of DL-dihydroxyphenylserine by mouth in 2 patients with life-

long orthostatic hypotension due to DBH deficiency. Both patients also had ptosis and nasal stuffiness all their lives. The agent bypasses the DBH deficiency since it is readily converted to noradrenaline by decarboxylation of the terminal carboxyl group. Mathias et al. (1990) described a brother and sister with long-standing symptoms of postural hypotension. In the male, erection was unaffected but ejaculation was prolonged or absent. Autonomic function tests confirmed sympathetic adrenergic failure with spared sympathetic cholinergic and intact parasympathetic function. There were no other neurologic abnormalities. Plasma dopamine was elevated, but noradrenaline and adrenaline were undetectable in the plasma, as was dopamine beta-hydroxylase activity. In perivascular cutaneous tissue, DBH immunoreactivity was absent. The parents were clinically and biochemically normal. Treatment with dihydroxyphenylserine reduced symptoms and signs of postural hypotension, increased plasma levels of noradrenaline, and, in the male, made ejaculation possible. Animal model experiments lend further support to the function of DBH. Thomas et al. (1995) used gene targeting to produce mice that lack *Dbh* and are therefore unable to synthesize noradrenaline or adrenaline. They found that in

heterozygous mothers, most homozygous embryos died in utero and only about 5% reached adulthood. Survival probably depended on catecholamine transfer across the placenta, because in homozygous mothers all embryos died in utero. Mortality was due to lack of noradrenaline in utero because it could be prevented by treatment with dihydroxyphenylserine (DOPS), a precursor that can be converted to noradrenaline in the absence of DBH. Mutant embryos had a histologic phenotype similar to that of embryos deficient in tyrosine hydroxylase suggesting that death might be due to cardiovascular failure, as was probably the case with TH-deficient embryos. Thomas and Palmiter (1997) found impaired maternal behavior in these mice with targeted disruption of the *Dbh* gene. Most heterozygous pups born to *Dbh*^{-/-} females died within several days of birth and were often found scattered within the bedding. Potential causes, including deficits in olfaction and lactation, were not apparent. A deficit in maternal behavior was confirmed by the lack of pup retrieval exhibited by *Dbh*^{-/-} virgin females. Restoration of norepinephrine shortly before but not after birth induced females that had previously abandoned their litters to act maternally. These results suggested to the authors that

norepinephrine is responsible for long-lasting changes that promote maternal behavior during both development and parturition in mice.

[42630] It is appreciated that the abovementioned animal model for DBH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[42631] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42632] Weinshilboum, R. M.; Schrott, H. G.; Raymond, F. A.; Weidman, W. H.; Elveback, L. R. : Inheritance of very low serum dopamine-beta-hydroxylase activity. *Am. J. Hum. Genet.* 27: 573-585, 1975. ; and

[42633] Mathias, C. J.; Bannister, R. B.; Cortelli, P.; Heslop, K.; Polak, J. M.; Raimbach, S.; Springall, D. R.; Watson, L. : Clinical, autonomic and therapeutic observations in two siblings.

[42634] Further studies establishing the function and utilities of DBH are found in John Hopkins OMIM database record ID 223360, and in cited publications numbered 9541-9555, 5226, 9556-9560, 3653, 5227, 9561-956 and 4567-1874 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Death Effector Domain Containing (DEDD, Accession NM_032998) is another VGAM1189 host target gene. DEDD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DEDD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEDD BINDING SITE, designated SEQ ID:26879, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42635] Another function of VGAM1189 is therefore inhibition of Death Effector Domain Containing (DEDD, Accession NM_032998), a gene which intervenes in apoptosis. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEDD. The function of DEDD has been established by previous studies. By EST database searching with sequences of DED-containing proteins, Leo et al. (1998) and Stegh et al. (1998) independently identified and cloned the human DEDD cDNA. The DEDD cDNA encodes a deduced 318-amino acid protein with an N-terminal DED domain and a calculated molecular mass of

about 37 kD. Leo et al. (1998) and Stegh et al. (1998) also cloned the rat and mouse homologs, respectively, which share approximately 98% sequence identity with the human protein. Northern blot analysis detected ubiquitous expression of DEDD mRNA, but particularly abundant expression in testis. In human tissues, Leo et al. (1998) detected a 2.1-kb transcript, whereas Stegh et al. (1998) detected a 2.3-kb transcript in all tissues as well as a 4.2-kb transcript in some tissues. By in situ hybridization, Leo et al. (1998) found that rat DEDD mRNA was specifically expressed in male germ cells but not in Sertoli cells. An increase in DEDD mRNA was detected following induction of germ cell apoptosis using a GnRH (OMIM Ref. No. 152760) antagonist. By immunolocalization experiments, Stegh et al. (1998) found that human DEDD localized to the cytoplasm in a nonapoptotic human leukemic cell line, but translocated to the nucleus upon induction of apoptosis, where it colocalized with the nucleolar transcription factor UBTF (OMIM Ref. No. 600673). Through mutation analysis and transient transfection of human kidney cells, Stegh et al. (1998) found that the N terminus of DEDD induces apoptosis and the C terminus has antiapoptotic activity. Further, FADD (OMIM Ref. No. 602457), one of several

DED-containing proteins with which DEDD directly interacts in coimmunoprecipitation experiments, enhances DEDD-mediated apoptosis. Translocation of DEDD to the nuclear compartment requires caspase activation. Stegh et al. (1998) found that recombinant DEDD binds to both DNA and reconstituted mononucleosomes and inhibits rDNA transcription in a reconstituted in vitro system.

[42636] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42637] Leo, C. P.; Hsu, S. Y.; McGee, E. A.; Salanova, M.; Hsueh, A. J. W. : DEFT, a novel death effector domain-containing molecule predominantly expressed in testicular germ cells. *Endocrinology* 139: 4839–4848, 1998. ; and

[42638] Stegh, A. H.; Schickling, O.; Ehret, A.; Scaffidi, C.; Peterhansel, C.; Hofmann, T. G.; Grummt, I.; Krammer, P. H.; Peter, M. E. : DEDD, a novel death effector domain-containing protein.

[42639] Further studies establishing the function and utilities of DEDD are found in John Hopkins OMIM database record ID 606841, and in cited publications numbered 6142–6143 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DNA

(cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NM_013369) is another VGAM1189 host target gene. DNMT3L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DNMT3L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3L BINDING SITE, designated SEQ ID:15018, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42640] Another function of VGAM1189 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NM_013369), a gene which plays a role in de novo methylation of CpG islands. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3L. The function of DNMT3L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM447. Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423) is another VGAM1189 host target gene. DVL3 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10693, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42641] Another function of VGAM1189 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.Ephrin-B1 (EFNB1, Accession NM_004429) is another VGAM1189 host target gene. EFNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of EFNB1 BINDING SITE, designated SEQ ID:10706, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42642] Another function of VGAM1189 is therefore inhibition of Ephrin-B1 (EFNB1, Accession NM_004429), a gene which is a transmembrane ligand of Eph-related receptor tyrosine kinases, has a role in cell adhesion. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB1. The function of EFNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390. Ems1 Sequence (mammary tumor and squamous cell carcinoma-associated (p80/85 src substrate) (EMS1, Accession NM_005231) is another VGAM1189 host target gene. EMS1 BINDING SITE1 and EMS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EMS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMS1 BINDING SITE1 and EMS1 BINDING SITE2,

designated SEQ ID:11736 and SEQ ID:28867 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42643] Another function of VGAM1189 is therefore inhibition of Ems1 Sequence (mammary tumor and squamous cell carcinoma-associated (p80/85 src substrate) (EMS1, Accession NM_005231), a gene which may contribute to the organization of cell structure. in transformed cells may contribute to cellular growth regulation and transformation. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMS1. The function of EMS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497. Endoglin (Osler-Rendu-Weber syndrome 1) (ENG, Accession NM_000118) is another VGAM1189 host target gene. ENG BINDING SITE1 and ENG BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ENG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENG BINDING SITE1 and ENG BIND-

ING SITE2, designated SEQ ID:5593 and SEQ ID:21745 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42644] Another function of VGAM1189 is therefore inhibition of Endoglin (Osler–Rendu–Weber syndrome 1) (ENG, Accession NM_000118). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENG. Fatty Acid Amide Hydrolase (FAAH, Accession NM_024306) is another VGAM1189 host target gene. FAAH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FAAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAAH BINDING SITE, designated SEQ ID:23597, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42645] Another function of VGAM1189 is therefore inhibition of Fatty Acid Amide Hydrolase (FAAH, Accession NM_024306), a gene which function as an electron carrier for several membrane bound oxygenases (by similarity).

Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAAH. The function of FAAH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM711. Formin-like (FMNL, Accession NM_005892) is another VGAM1189 host target gene. FMNL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FMNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMNL BINDING SITE, designated SEQ ID:12511, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42646] Another function of VGAM1189 is therefore inhibition of Formin-like (FMNL, Accession NM_005892), a gene which controls the reorganization of the actin cytoskeleton in association with Rac. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMNL. The function of FMNL and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM615.FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM_006732) is another VGAM1189 host target gene. FOSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOSB BINDING SITE, designated SEQ ID:13582, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42647] Another function of VGAM1189 is therefore inhibition of FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM_006732), a gene which interacts with jun proteins enhancing their dna binding activity. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOSB. The function of FOSB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM747.Guanine Nucleotide

Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM_002074) is another VGAM1189 host target gene. GNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB1 BINDING SITE, designated SEQ ID:7849, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42648] Another function of VGAM1189 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM_002074). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB1. Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM_000843) is another VGAM1189 host target gene. GRM6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GRM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM6 BINDING SITE, des-

ignated SEQ ID:6506, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42649] Another function of VGAM1189 is therefore inhibition of Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM_000843). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM6. GTF2I Repeat Domain Containing 1 (GTF2IRD1, Accession NM_016328) is another VGAM1189 host target gene. GTF2IRD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GTF2IRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2IRD1 BINDING SITE, designated SEQ ID:18451, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42650] Another function of VGAM1189 is therefore inhibition of GTF2I Repeat Domain Containing 1 (GTF2IRD1, Accession NM_016328). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2IRD1. Hyperpolariza-

tion Activated Cyclic Nucleotide-gated Potassium Channel 2 (HCN2, Accession NM_001194) is another VGAM1189 host target gene. HCN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCN2 BINDING SITE, designated SEQ ID:6864, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42651] Another function of VGAM1189 is therefore inhibition of Hyperpolarization Activated Cyclic Nucleotide-gated Potassium Channel 2 (HCN2, Accession NM_001194), a gene which is hyperpolarization-activated cyclic nucleotide-gated cation channel 2 and may act as a pacemaker channel in the brain and the heart. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCN2. The function of HCN2 has been established by previous studies. Ludwig et al. (1999) observed that when expressed in HEK293 cells, HCN2 gives rise to hyperpolarization-activated cation currents with the hallmark fea-

tures of the native cation current. HCN2 has fast activation kinetics, and Ludwig et al. (1999) concluded that HCN2 may underlie the fast component of the cardiac hyperpolarization-activated cation current. By constructing truncation mutants, Wainger et al. (2001) demonstrated that the CNBD inhibits activation of the core transmembrane domain of HCN family members. Cyclic AMP binding relieves this inhibition. Differences in activation gating and extent of cAMP modulation between the HCN1 and HCN2 isoforms result largely from differences in the efficacy of CNBD inhibition.

[42652] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42653] Ludwig, A.; Zong, X.; Stieber, J.; Hullin, R.; Hofmann, F.; Biel, M. : Two pacemaker channels from human heart with profoundly different activation kinetics. EMBO J. 18: 2323–2329, 1999. ; and

[42654] Santoro, B.; Grant, S. G. N.; Bartsch, D.; Kandel, E. R. : Interactive cloning with the SH3 domain of N-src identifies a new brain specific ion channel protein, with homology to Eag and.

[42655] Further studies establishing the function and utilities of

HCN2 are found in John Hopkins OMIM database record ID 602781, and in cited publications numbered 7659–765 and 7658 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 2 Receptor, Beta (IL2RB, Accession NM_000878) is another VGAM1189 host target gene. IL2RB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL2RB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RB BINDING SITE, designated SEQ ID:6570, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42656] Another function of VGAM1189 is therefore inhibition of Interleukin 2 Receptor, Beta (IL2RB, Accession NM_000878), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RB. The function of IL2RB and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM450. Interleukin 6 Receptor (IL6R, Accession NM_000565) is another VGAM1189 host target gene. IL6R BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL6R BINDING SITE, designated SEQ ID:6172, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42657] Another function of VGAM1189 is therefore inhibition of Interleukin 6 Receptor (IL6R, Accession NM_000565), a gene which is essential to the regulation of the immune response, hematopoiesis, and acute-phase reactions. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL6R. The function of IL6R has been established by previous studies. Whereas the 0.9-kb IFN-beta-1 mRNA is transcribed from an intron-free IFNB1 gene located on 9p (OMIM Ref. No. 147640), IFN-beta-2 is the translation product of a 1.3-kb mRNA derived from an intron-containing IFNB2 gene not located on chromo-

some 9. The IFN-beta-2 mRNA does not cross-hybridize with IFN-beta-1 cDNA probes and vice-versa. Sehgal et al. (1986) mapped IFNB2 to chromosome 7 by means of a cDNA clone in blot-hybridization experiments on DNA from a panel of human-rodent somatic cell hybrids. Zilberstein et al. (1986) cloned cDNA for the 1.3-kb RNA designated IFNB2. Expression studies showed that the IFN-beta-2 secreted by DNA-transformed rodent cells is a processed 21-kD protein whose activity is cross-neutralized by antibodies to human IFN-beta-1 but not to alpha or gamma interferon. The biologic significance of IFN-beta-2 lies in the fact that it is induced under conditions in which IFN-beta-1 is not induced, as in metabolically stressed cells. Its induction by IL1 (OMIM Ref. No. 147720) and TNF (OMIM Ref. No. 191160) suggests that it may play a role as an autocrine mediator of some effects of these cytokines in inflammation and acute phase responses, as well as regulate cell proliferation. As discussed by Sehgal et al. (1987), IFNB2 is identical to B-cell differentiation factor (BSF2) and enhances proliferation in hybridoma/plasmacytoma cells. Hirano et al. (1986) reported the molecular cloning, structural analysis, and functional expression of cDNA encoding human BSF2. The

primary sequence of BSF2 deduced from the cDNA shows that it has 184 amino acids and is distinct from other interleukins. In addition to its antiviral activity, beta-2 interferon elicits acute phase response in liver cells and is identical to hepatocyte stimulatory factor. It also is identical to hybridoma growth factor. A subset of plasmacytoma (PCT), designated extramedullary PCT, is distinguished from multiple myeloma and solitary PCT of bone by its distribution among various tissue sites but not bone marrow. Extramedullary (extraosseous) PCTs are rare spontaneous neoplasms of mice but are readily induced in a susceptible strain, BALB/c, by treatment with pristane. The tumors develop in peritoneal granulomas and are characterized by Myc-activating t(12;15) chromosomal translocations and, most frequently, by secretion of IgA. To test directly the contribution of IL6 to PCT development, Kovalchuk et al. (2002) generated BALB/c mice carrying a widely expressed IL6 transgene. All mice exhibited lymphoproliferation and plasmacytosis. By 18 months of age, more than half developed readily transplantable PCTs in lymph nodes, Peyer patches, and sometimes spleen. These neoplasms also had the t(12;15) translocations, but remarkably, none expressed IgA. Approximately 30% of

the mice developed follicular and diffuse large cell B-cell lymphomas that often coexisted with PCTs. These findings provided a unique model of extramedullary PCT for studies on pathogenesis and treatment and suggested a role for IL6 in the genesis of germinal center-derived lymphomas

[42658] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42659] Hirano, T.; Yasukawa, K.; Harada, H.; Taga, T.; Watanabe, Y.; Matsuda, T.; Kashiwamura, S.; Nakajima, K.; Koyama, K.; Iwamatsu, A.; Tsunasawa, S.; Sakiyama, F.; Matsui, H.; Takahara, Y.; Taniguchi, T.; Kishimoto, T. : Complementary DNA for a novel human interleukin (BSF-2) that induces B lymphocytes to produce immunoglobulin. *Nature* 324: 73-76, 1986. ; and

[42660] Kovalchuk, A. L.; Kim, J. S.; Park, S. S.; Coleman, A. E.; Ward, J. M.; Morse, H. C, III; Kishimoto, T.; Potter, M.; Janz, S. : IL-6 transgenic mouse model for extraosseous plasmacytoma.

[42661] Further studies establishing the function and utilities of IL6R are found in John Hopkins OMIM database record ID 147880, and in cited publications numbered 397 and

3976 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885) is another VGAM1189 host target gene. ITGA4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ITGA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA4 BINDING SITE, designated SEQ ID:6580, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42662] Another function of VGAM1189 is therefore inhibition of Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885), a gene which recognizes one or more domains within the alternatively spliced cs-1 and cs-5 regions of fibronectin. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA4. The function of ITGA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM1096. Integrin, Beta 4 (ITGB4, Accession NM_000213) is another VGAM1189 host target gene.

ITGB4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ITGB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB4 BINDING SITE, designated SEQ ID:5710, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42663] Another function of VGAM1189 is therefore inhibition of Integrin, Beta 4 (ITGB4, Accession NM_000213), a gene which plays a critical structural role in the hemidesmosome of epithelial cells. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB4. The function of ITGB4 has been established by previous studies. Integrins are transmembrane glycoprotein receptors that mediate cell-matrix or cell-cell adhesion, and transduced signals that regulate gene expression and cell growth (Vidal et al., 1995). These heterodimeric molecules consist of noncovalently linked alpha and beta subunits. Different combinations of alpha and beta polypeptides

form complexes that vary in their ligand-binding specificities. Both alpha and beta subunits display a cytoplasmic domain that interacts with the cytoskeleton (and possibly signaling molecules), a transmembrane region, and a large extracellular domain that interacts with the extracellular matrix. Leukocyte adhesion deficiency is due to a defect in the integrin beta-2 chain (OMIM Ref. No. 600065) and Glanzmann thrombasthenia (OMIM Ref. No. 273800) is also due to mutation in an integrin gene. In the human epidermis, basal keratinocytes express integrins alpha-2/beta-1, alpha-3/beta-1, and alpha-6/beta-4. The first 2 of these are located primarily at the lateral surface of these cells, suggesting a role in cell-cell interaction, whereas the third, alpha-6/beta-4, is restricted to the ventral surface opposed to the basal membrane zone, suggestive of its role in cell-matrix adhesion. Consistent with this possibility, alpha-6/beta-4 is found to be associated with the hemidesmosomes in stratified and transitional epithelia. Hemidesmosomes are dense cytoplasmic plaques that mediate the attachment of stratified squamous epithelium to the underlying dermis by connecting with the extracellular anchoring filaments of the basement membrane. Epidermolysis bullosa of the junctional Herlitz

type has been related to mutations in each of the 3 genes encoding laminin 5: LAMC2 (OMIM Ref. No. 150292), LAMB3 (OMIM Ref. No. 150310), and a third component. In a case of junctional epidermolysis bullosa associated with pyloric atresia (OMIM Ref. No. 226730), Vidal et al. (1995) found no mutation in any of these genes but identified a mutation in the ITGB4 gene; indeed, they found 2 mutations in the compound heterozygous patient (147557.0001 and 147557.0002). Nakano et al. (2001) identified 11 novel mutations in ITGB4 in patients with epidermolysis bullosa with congenital pyloric atresia. Four mutations predicted a premature termination codon and 7 were missense mutations. Of the 33 mutations reported to that time, those causing premature termination codons were associated with the lethal variant, whereas missense mutations were more prevalent in nonlethal forms. In general, indirect immunofluorescent studies of affected skin revealed negative staining for beta-4 integrin in lethal cases and positive, but attenuated, staining in non-lethal cases and correlated with clinical phenotype

[42664] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [42665] Vidal, F.; Aberdam, D.; Miquel, C.; Christiano, A. M.; Pulkkinen, L.; Uitto, J.; Ortonne, J.-P.; Meneguzzi, G. : Integrin beta-4 mutations associated with junctional epidermolysis bullosa with pyloric atresia. *Nature Genet.* 10: 229-234, 1995. ; and
- [42666] Nakano, A.; Pulkkinen, L.; Murrell, D.; Rico, J.; Lucky, A. W.; Garzon, M.; Stevens, C. A.; Robertson, S.; Pfendner, E.; Uitto, J. : Epidermolysis bullosa with congenital pyloric atresia.
- [42667] Further studies establishing the function and utilities of ITGB4 are found in John Hopkins OMIM database record ID 147557, and in cited publications numbered 4477, 4478-4479, 3 and 12517-12522 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ladinin 1 (LAD1, Accession NM_005558) is another VGAM1189 host target gene. LAD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAD1 BINDING SITE, designated SEQ ID:12085, to the nucleotide sequence of VGAM1189 RNA, herein

designated VGAM RNA, also designated SEQ ID:3900.

[42668] Another function of VGAM1189 is therefore inhibition of Ladinin 1 (LAD1, Accession NM_005558). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAD1. LIM Domain Kinase 1 (LIMK1, Accession NM_016735) is another VGAM1189 host target gene. LIMK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIMK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE, designated SEQ ID:18796, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42669] Another function of VGAM1189 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_016735). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Lipin 2 (LPIN2, Accession NM_014646) is another VGAM1189 host target gene. LPIN2 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by LPIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN2 BINDING SITE, designated SEQ ID:16061, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42670] Another function of VGAM1189 is therefore inhibition of Lipin 2 (LPIN2, Accession NM_014646). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN2. Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_015166) is another VGAM1189 host target gene. MLC1 BINDING SITE1 and MLC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MLC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLC1 BINDING SITE1 and MLC1 BINDING SITE2, designated SEQ ID:17522 and SEQ ID:29216 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42671] Another function of VGAM1189 is therefore inhibition of Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_015166). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLC1. Pleckstrin and Sec7 Domain Protein (PSD, Accession NM_002779) is another VGAM1189 host target gene. PSD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PSD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSD BINDING SITE, designated SEQ ID:8669, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42672] Another function of VGAM1189 is therefore inhibition of Pleckstrin and Sec7 Domain Protein (PSD, Accession NM_002779), a gene which promotes guanine-nucleotide exchange on arf6. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSD. The function of PSD and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to VGAM261.Parathymosin (PTMS, Accession NM_002824) is another VGAM1189 host target gene. PTMS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTMS BINDING SITE, designated SEQ ID:8694, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42673] Another function of VGAM1189 is therefore inhibition of Parathymosin (PTMS, Accession NM_002824), a gene which is involved in the regulation of cellular immunity. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTMS. The function of PTMS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Pvt1 Oncogene Homolog, MYC Activator (mouse) (PVT1, Accession XM_037656) is another VGAM1189 host target gene. PVT1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by PVT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PVT1 BINDING SITE, designated SEQ ID:32661, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42674] Another function of VGAM1189 is therefore inhibition of Pvt1 Oncogene Homolog, MYC Activator (mouse) (PVT1, Accession XM_037656). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PVT1. PYGO2 (Accession XM_034083) is another VGAM1189 host target gene. PYGO2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PYGO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGO2 BINDING SITE, designated SEQ ID:31998, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42675] Another function of VGAM1189 is therefore inhibition of

PYGO2 (Accession XM_034083). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGO2. Scratch Homolog 1, Zinc Finger Protein (Drosophila) (SCRT1, Accession NM_031309) is another VGAM1189 host target gene. SCRT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCRT1 BINDING SITE, designated SEQ ID:25345, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42676] Another function of VGAM1189 is therefore inhibition of Scratch Homolog 1, Zinc Finger Protein (Drosophila) (SCRT1, Accession NM_031309), a gene which is involved in the generation and migration of neural crest cells. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCRT1. The function of SCRT1 has been established by previous studies. Nakakura et al. (2001) isolated human SCRT from an adult brain cDNA library.

The SCRT cDNA encodes a protein of 348 amino acids. Human SCRT shares 81% and 69% identity to *Drosophila* Scrt and *Caenorhabditis elegans* neuronal antiapoptotic protein, CES-1, respectively, across the 5-zinc finger domain, and 92% overall amino acid identity with mouse Scrt. Northern blot analysis detected SCRT expression in adult brain, but not in other tissues. In situ hybridization of mouse tissues demonstrated expression of Scrt predominantly confined to the brain and spinal cord, appearing in newly differentiating, postmitotic neurons and persisting into postnatal life. Additional expression was seen in the retina and, significantly, in neuroendocrine cells of the lung. In a parallel fashion, Nakakura et al. (2001) detected SCRT expression by RT-PCR in lung cancers with neuroendocrine features, especially small cell lung cancer. SCRT shares the capacity of other Snail family members to bind to E-box enhancer motifs, which are targets of basic helix-loop-helix (bHLH) transcription factors. Nakakura et al. (2001) showed that SCRT directly antagonizes the function of heterodimers of the proneural bHLH protein achaete-scute homolog-1 (ASCL1; 100790) and E12 (see OMIM Ref. No. 147141), leading to active transcriptional repression at E-box motifs. Nakakura et al. (2001) con-

cluded that SCRT has the potential to function in newly differentiating, postmitotic neurons and in cancers with neuroendocrine features by modulating the action of bHLH transcription factors critical for neuronal differentiation.

[42677] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42678] Nakakura, E. K.; Watkins, D. N.; Schuebel, K. E.; Sriuranpong, V.; Borges, M. W.; Nelkin, B. D.; Ball, D. W. : Mammalian Scratch: a neural-specific Snail family transcriptional repressor. *Proc. Nat. Acad. Sci.* 98: 4010–4015, 2001. ; and

[42679] Scott, A. F. : Personal Communication. Baltimore, Md., 6/21/2001.

[42680] Further studies establishing the function and utilities of SCRT1 are found in John Hopkins OMIM database record ID 605858, and in cited publications numbered 6780–6781 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM_006598) is another VGAM1189 host target gene. SLC12A7 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC12A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:13373, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42681] Another function of VGAM1189 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM_006598), a gene which is a potassium/chloride-cotransporter. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7. The function of SLC12A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM_005629) is another VGAM1189 host target gene. SLC6A8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC6A8, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A8 BINDING SITE, designated SEQ ID:12146, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42682] Another function of VGAM1189 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM_005629). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A8. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM1189 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:11063, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42683] Another function of VGAM1189 is therefore inhibition of

Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Transcription Factor 1, Hepatic; LF-B1, Hepatic Nuclear Factor (HNF1), Albumin Proximal Factor (TCF1, Accession NM_000545) is another VGAM1189 host target gene. TCF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF1 BINDING SITE, designated SEQ ID:6145, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42684] Another function of VGAM1189 is therefore inhibition of Transcription Factor 1, Hepatic; LF-B1, Hepatic Nuclear Factor (HNF1), Albumin Proximal Factor (TCF1, Accession

NM_000545), a gene which is required for the expression of several liver specific genes. binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF1. The function of TCF1 has been established by previous studies. The orderly and sequential activation of genes during development is thought to be related to the selective expression of groups of regulatory proteins acting primarily at the level of transcription. Courtois et al. (1987) found a nuclear protein in hepatocytes, but not in other cell types, that binds to a sequence required for hepatocyte-specific transcription of the genes for the alpha and beta chains of fibrinogen (134820, 134830) and alpha-1-antitrypsin (OMIM Ref. No. 107400). This protein, called hepatocyte nuclear factor-1 (HNF1) by them, interacts with sequences required for optimal promoter function of the genes mentioned. The promoter or enhancer regions for several viral and cellular genes not expressed in the liver did not compete for binding to these sequences. HNF1 is predominantly expressed in liver and kidney. The restricted expression of HNF1 and its selective interaction with the control regions of several liver-

specific genes suggested to Courtois et al. (1987) that it is involved in developmentally regulated gene expression in the liver. HNF1 binds to the promoters of a variety of genes that are expressed exclusively in the liver, e.g., fibrinogen-alpha and -beta, albumin (OMIM Ref. No. 103600), alpha-fetoprotein (OMIM Ref. No. 104150), alpha-1-antitrypsin, liver-type pyruvate kinase (OMIM Ref. No. 266200), transthyretin (OMIM Ref. No. 176300), aldolase B (OMIM Ref. No. 229600), and hepatitis B virus large surface protein. The amino acid sequence of HNF1 displays distant sequence homology to the homeodomains of homeotic genes (see OMIM Ref. No. 142950). Animal model experiments lend further support to the function of TCF1. Gonzalez et al. (1990) found that newborn mice homozygous for a 1.2-cM deletion of chromosome 7 do not show the increased activity of CYP2E (OMIM Ref. No. 124040), which is regulated by the transcription factor Hnf1. They suggested that the deleted region of chromosome 7 contains a gene encoding a transacting factor that is epistatic in a regulatory cascade that includes Hnf1 gene expression.

[42685] It is appreciated that the abovementioned animal model for TCF1 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[42686] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42687] Courtois, G.; Morgan, J. G.; Campbell, L. A.; Fourel, G.; Crabtree, G. R. : Interaction of a liver-specific nuclear factor with the fibrinogen and alpha-1-antitrypsin promoters. Science 238: 688-692, 1987. ; and

[42688] Gonzalez, F. J.; Liu, S.-Y.; Kozak, C. A.; Nebert, D. W. : Decreased Hnf-1 gene expression in mice homozygous for a 1.2-centimorgan deletion on chromosome 7. DNA Cell Biol. 9: 771-776.

[42689] Further studies establishing the function and utilities of TCF1 are found in John Hopkins OMIM database record ID 142410, and in cited publications numbered 4979, 5201-435, 12032-448, 4365-450, 11556-1155 and 12288-11564 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM_003202) is another VGAM1189 host target gene. TCF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by TCF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:9192, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42690] Another function of VGAM1189 is therefore inhibition of Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM_003202). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7. Transforming Growth Factor, Beta 1 (Camurati-Engelmann disease) (TGFB1, Accession NM_000660) is another VGAM1189 host target gene. TGFB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB1 BINDING SITE, designated SEQ ID:6319, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42691] Another function of VGAM1189 is therefore inhibition of Transforming Growth Factor, Beta 1 (Camurati-Engelmann disease) (TGFB1, Accession NM_000660). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB1. Tumor Necrosis Factor, Alpha-induced Protein 2 (TNFAIP2, Accession NM_006291) is another VGAM1189 host target gene. TNFAIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFAIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP2 BINDING SITE, designated SEQ ID:12981, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42692] Another function of VGAM1189 is therefore inhibition of Tumor Necrosis Factor, Alpha-induced Protein 2 (TNFAIP2, Accession NM_006291). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP2. Upstream Binding Transcription Factor, RNA Polymerase I (UBTF, Accession NM_014233) is another

VGAM1189 host target gene. UBTF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBTF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBTF BINDING SITE, designated SEQ ID:15496, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42693] Another function of VGAM1189 is therefore inhibition of Upstream Binding Transcription Factor, RNA Polymerase I (UBTF, Accession NM_014233), a gene which recognizes the ribosomal rna gene promoter and activates transcription. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBTF. The function of UBTF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM626. Zinc Finger Protein 42 (myeloid-specific retinoic acid- responsive) (ZNF42, Accession NM_003422) is another VGAM1189 host target gene. ZNF42 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by ZNF42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF42 BINDING SITE, designated SEQ ID:9466, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42694] Another function of VGAM1189 is therefore inhibition of Zinc Finger Protein 42 (myeloid-specific retinoic acid-responsive) (ZNF42, Accession NM_003422), a gene which may be one regulator of transcriptional events during hemopoietic development. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF42. The function of ZNF42 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM_006411) is another VGAM1189 host target gene. AGPAT1 BINDING SITE1 and AGPAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AG-

PAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT1 BINDING SITE1 and AGPAT1 BINDING SITE2, designated SEQ ID:13116 and SEQ ID:26472 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42695] Another function of VGAM1189 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 1 (lysophosphatidic acid acyltransferase, alpha) (AGPAT1, Accession NM_006411). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGPAT1. Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM_016605) is another VGAM1189 host target gene. C5orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf6 BINDING SITE, designated SEQ ID:18700, to the nucleotide sequence of VGAM1189 RNA,

herein designated VGAM RNA, also designated SEQ ID:3900.

[42696] Another function of VGAM1189 is therefore inhibition of Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM_016605). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf6. Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175) is another VGAM1189 host target gene. C8orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf2 BINDING SITE, designated SEQ ID:14021, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42697] Another function of VGAM1189 is therefore inhibition of Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf2. Cab45 (Accession NM_016176) is another VGAM1189 host target gene.

Cab45 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Cab45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Cab45 BINDING SITE, designated SEQ ID:18277, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42698] Another function of VGAM1189 is therefore inhibition of Cab45 (Accession NM_016176). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Cab45. Chromobox Homolog 6 (CBX6, Accession NM_014292) is another VGAM1189 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15574, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42699] Another function of VGAM1189 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM_014292). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. Cell Division Cycle Associated 4 (CDCA4, Accession NM_017955) is another VGAM1189 host target gene. CDCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDCA4 BINDING SITE, designated SEQ ID:19661, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42700] Another function of VGAM1189 is therefore inhibition of Cell Division Cycle Associated 4 (CDCA4, Accession NM_017955). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDCA4. Complexin 1 (CPLX1, Accession NM_006651) is another VGAM1189 host target gene. CPLX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by CPLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPLX1 BINDING SITE, designated SEQ ID:13447, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42701] Another function of VGAM1189 is therefore inhibition of Complexin 1 (CPLX1, Accession NM_006651). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1. Cysteine-rich with EGF-like Domains 1 (CRELD1, Accession NM_015513) is another VGAM1189 host target gene. CRELD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CRELD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRELD1 BINDING SITE, designated SEQ ID:17774, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42702] Another function of VGAM1189 is therefore inhibition of

Cysteine-rich with EGF-like Domains 1 (CRELD1, Accession NM_015513). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRELD1. CXYorf1 (Accession XM_088704) is another VGAM1189 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39905, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42703] Another function of VGAM1189 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734) is another VGAM1189 host target gene. DCAMKL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DCAMKL1, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCAMKL1 BINDING SITE, designated SEQ ID:11114, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42704] Another function of VGAM1189 is therefore inhibition of Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCAMKL1. DKFZp434C0328 (Accession NM_017577) is another VGAM1189 host target gene. DKFZp434C0328 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434C0328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0328 BINDING SITE, designated SEQ ID:19010, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42705] Another function of VGAM1189 is therefore inhibition of

DKFZp434C0328 (Accession NM_017577). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0328. Ephrin-A5 (EFNA5, Accession NM_001962) is another VGAM1189 host target gene. EFNA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNA5 BINDING SITE, designated SEQ ID:7685, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42706] Another function of VGAM1189 is therefore inhibition of Ephrin-A5 (EFNA5, Accession NM_001962). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNA5. FLJ10637 (Accession XM_043919) is another VGAM1189 host target gene. FLJ10637 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10637, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10637 BINDING SITE, designated SEQ ID:34042, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42707] Another function of VGAM1189 is therefore inhibition of FLJ10637 (Accession XM_043919). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10637. FLJ10700 (Accession NM_018182) is another VGAM1189 host target gene. FLJ10700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10700 BINDING SITE, designated SEQ ID:20019, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42708] Another function of VGAM1189 is therefore inhibition of FLJ10700 (Accession NM_018182). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10700. FLJ10743 (Accession NM_018201) is another

VGAM1189 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:20076, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42709] Another function of VGAM1189 is therefore inhibition of FLJ10743 (Accession NM_018201). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10743. FLJ13204 (Accession NM_024761) is another VGAM1189 host target gene. FLJ13204 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:24114, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42710] Another function of VGAM1189 is therefore inhibition of FLJ13204 (Accession NM_024761). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13204. FLJ13322 (Accession NM_024722) is another VGAM1189 host target gene. FLJ13322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13322 BINDING SITE, designated SEQ ID:24058, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42711] Another function of VGAM1189 is therefore inhibition of FLJ13322 (Accession NM_024722). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13322. FLJ13881 (Accession NM_024729) is another VGAM1189 host target gene. FLJ13881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13881 BINDING SITE, designated SEQ ID:24066, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42712] Another function of VGAM1189 is therefore inhibition of FLJ13881 (Accession NM_024729). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13881. FLJ14100 (Accession NM_025025) is another VGAM1189 host target gene. FLJ14100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14100 BINDING SITE, designated SEQ ID:24614, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42713] Another function of VGAM1189 is therefore inhibition of FLJ14100 (Accession NM_025025). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14100. FLJ14327 (Accession NM_024912) is another VGAM1189 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:24424, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42714] Another function of VGAM1189 is therefore inhibition of FLJ14327 (Accession NM_024912). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14327. FLJ20257 (Accession NM_019606) is another VGAM1189 host target gene. FLJ20257 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20257 BINDING SITE, designated SEQ ID:21222, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM

RNA, also designated SEQ ID:3900.

[42715] Another function of VGAM1189 is therefore inhibition of FLJ20257 (Accession NM_019606). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20257. FLJ22301 (Accession NM_024836) is another VGAM1189 host target gene. FLJ22301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22301 BINDING SITE, designated SEQ ID:24240, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42716] Another function of VGAM1189 is therefore inhibition of FLJ22301 (Accession NM_024836). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22301. FLJ31300 (Accession NM_144639) is another VGAM1189 host target gene. FLJ31300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31300, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31300 BINDING SITE, designated SEQ ID:29462, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42717] Another function of VGAM1189 is therefore inhibition of FLJ31300 (Accession NM_144639). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31300. GABA(A) Receptor-associated Protein Like 1 (GABARAPL1, Accession NM_031412) is another VGAM1189 host target gene. GABARAPL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GABARAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL1 BINDING SITE, designated SEQ ID:25390, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42718] Another function of VGAM1189 is therefore inhibition of GABA(A) Receptor-associated Protein Like 1 (GABARAPL1,

Accession NM_031412). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL1. GBTS1 (Accession NM_145173) is another VGAM1189 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE, designated SEQ ID:29727, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42719] Another function of VGAM1189 is therefore inhibition of GBTS1 (Accession NM_145173). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBTS1. HS6ST (Accession XM_030529) is another VGAM1189 host target gene. HS6ST BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS6ST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of HS6ST BINDING SITE, designated SEQ ID:31071, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42720] Another function of VGAM1189 is therefore inhibition of HS6ST (Accession XM_030529). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS6ST. Heparan Sulfate 6-O-sulfotransferase 1 (HS6ST1, Accession NM_004807) is another VGAM1189 host target gene. HS6ST1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS6ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS6ST1 BINDING SITE, designated SEQ ID:11229, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42721] Another function of VGAM1189 is therefore inhibition of Heparan Sulfate 6-O-sulfotransferase 1 (HS6ST1, Accession NM_004807). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with HS6ST1. HSPC195 (Accession XM_087785) is another VGAM1189 host target gene. HSPC195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC195 BINDING SITE, designated SEQ ID:39421, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42722] Another function of VGAM1189 is therefore inhibition of HSPC195 (Accession XM_087785). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC195. HYPC (Accession XM_035487) is another VGAM1189 host target gene. HYPC BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HYPC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYPC BINDING SITE, designated SEQ ID:32272, to the nucleotide sequence of

VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42723] Another function of VGAM1189 is therefore inhibition of HYPC (Accession XM_035487). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYPC. ISL2 Transcription Factor, LIM/homeodomain, (islet-2) (ISL2, Accession XM_047951) is another VGAM1189 host target gene. ISL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ISL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ISL2 BINDING SITE, designated SEQ ID:35080, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42724] Another function of VGAM1189 is therefore inhibition of ISL2 Transcription Factor, LIM/homeodomain, (islet-2) (ISL2, Accession XM_047951). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISL2. KIAA0140 (Accession NM_014661) is another VGAM1189

host target gene. KIAA0140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0140 BINDING SITE, designated SEQ ID:16107, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42725] Another function of VGAM1189 is therefore inhibition of KIAA0140 (Accession NM_014661). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0140. KIAA0227 (Accession XM_027236) is another VGAM1189 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:30451, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42726] Another function of VGAM1189 is therefore inhibition of KIAA0227 (Accession XM_027236). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0227. KIAA0415 (Accession XM_166527) is another VGAM1189 host target gene. KIAA0415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0415 BINDING SITE, designated SEQ ID:44474, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42727] Another function of VGAM1189 is therefore inhibition of KIAA0415 (Accession XM_166527). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0415. KIAA0446 (Accession XM_044155) is another VGAM1189 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34148, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42728] Another function of VGAM1189 is therefore inhibition of KIAA0446 (Accession XM_044155). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. KIAA0481 (Accession XM_050144) is another VGAM1189 host target gene. KIAA0481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0481 BINDING SITE, designated SEQ ID:35569, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42729] Another function of VGAM1189 is therefore inhibition of KIAA0481 (Accession XM_050144). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0481. KIAA0841 (Accession XM_049237) is another VGAM1189 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35360, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42730] Another function of VGAM1189 is therefore inhibition of KIAA0841 (Accession XM_049237). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. KIAA0939 (Accession XM_030524) is another VGAM1189 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31060, to the nucleotide sequence of VGAM1189 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3900.

[42731] Another function of VGAM1189 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA0963 (Accession NM_014963) is another VGAM1189 host target gene. KIAA0963 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0963 BINDING SITE, designated SEQ ID:17342, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42732] Another function of VGAM1189 is therefore inhibition of KIAA0963 (Accession NM_014963). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0963. KIAA1138 (Accession XM_030721) is another VGAM1189 host target gene. KIAA1138 BINDING SITE1 and KIAA1138 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

KIAA1138, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1138 BINDING SITE1 and KIAA1138 BINDING SITE2, designated SEQ ID:31125 and SEQ ID:31126 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42733] Another function of VGAM1189 is therefore inhibition of KIAA1138 (Accession XM_030721). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1138. KIAA1441 (Accession XM_114036) is another VGAM1189 host target gene. KIAA1441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1441 BINDING SITE, designated SEQ ID:42627, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42734] Another function of VGAM1189 is therefore inhibition of

KIAA1441 (Accession XM_114036). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1441. KIAA1453 (Accession NM_025090) is another VGAM1189 host target gene. KIAA1453 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1453 BINDING SITE, designated SEQ ID:24713, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42735] Another function of VGAM1189 is therefore inhibition of KIAA1453 (Accession NM_025090). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1453. KIAA1553 (Accession XM_166320) is another VGAM1189 host target gene. KIAA1553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1553 BINDING SITE, designated SEQ ID:44142, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42736] Another function of VGAM1189 is therefore inhibition of KIAA1553 (Accession XM_166320). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1553. KIAA1580 (Accession XM_045271) is another VGAM1189 host target gene. KIAA1580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1580 BINDING SITE, designated SEQ ID:34411, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42737] Another function of VGAM1189 is therefore inhibition of KIAA1580 (Accession XM_045271). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1580. KIAA1813 (Accession XM_046743) is another

VGAM1189 host target gene. KIAA1813 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1813 BINDING SITE, designated SEQ ID:34808, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42738] Another function of VGAM1189 is therefore inhibition of KIAA1813 (Accession XM_046743). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1813. KIAA1893 (Accession XM_055226) is another VGAM1189 host target gene. KIAA1893 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1893 BINDING SITE, designated SEQ ID:36245, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42739] Another function of VGAM1189 is therefore inhibition of KIAA1893 (Accession XM_055226). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1893. KIAA1904 (Accession XM_056282) is another VGAM1189 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36373, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42740] Another function of VGAM1189 is therefore inhibition of KIAA1904 (Accession XM_056282). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. KIAA1924 (Accession XM_057091) is another VGAM1189 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36473, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42741] Another function of VGAM1189 is therefore inhibition of KIAA1924 (Accession XM_057091). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. Lectin, Galactoside-binding, Soluble, 12 (galectin 12) (LGALS12, Accession NM_033101) is another VGAM1189 host target gene. LGALS12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LGALS12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGALS12 BINDING SITE, designated SEQ ID:26947, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42742] Another function of VGAM1189 is therefore inhibition of Lectin, Galactoside-binding, Soluble, 12 (galectin 12) (LGALS12, Accession NM_033101). Accordingly, utilities of

VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGALS12. MGC10966 (Accession NM_031471) is another VGAM1189 host target gene. MGC10966 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC10966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10966 BINDING SITE, designated SEQ ID:25536, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42743] Another function of VGAM1189 is therefore inhibition of MGC10966 (Accession NM_031471). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10966. MGC2705 (Accession NM_032701) is another VGAM1189 host target gene. MGC2705 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2705

BINDING SITE, designated SEQ ID:26415, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42744] Another function of VGAM1189 is therefore inhibition of MGC2705 (Accession NM_032701). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2705. MGC2827 (Accession NM_023940) is another VGAM1189 host target gene. MGC2827 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2827 BINDING SITE, designated SEQ ID:23425, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42745] Another function of VGAM1189 is therefore inhibition of MGC2827 (Accession NM_023940). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2827. Meningioma Expressed Antigen 6 (coiled-coil proline-rich) (MGEA6, Accession NM_005930) is another

VGAM1189 host target gene. MGEA6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGEA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA6 BINDING SITE, designated SEQ ID:12559, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42746] Another function of VGAM1189 is therefore inhibition of Meningioma Expressed Antigen 6 (coiled-coil proline-rich) (MGEA6, Accession NM_005930). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGEA6. N4BP3 (Accession XM_038920) is another VGAM1189 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32932, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3900.

[42747] Another function of VGAM1189 is therefore inhibition of N4BP3 (Accession XM_038920). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. NFASC (Accession XM_046808) is another VGAM1189 host target gene. NFASC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFASC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFASC BINDING SITE, designated SEQ ID:34828, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42748] Another function of VGAM1189 is therefore inhibition of NFASC (Accession XM_046808). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFASC. NOPAR (Accession NM_053002) is another VGAM1189 host target gene. NOPAR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NOPAR, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOPAR BINDING SITE, designated SEQ ID:27570, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42749] Another function of VGAM1189 is therefore inhibition of NOPAR (Accession NM_053002). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOPAR. OS4 (Accession NM_005730) is another VGAM1189 host target gene. OS4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OS4 BINDING SITE, designated SEQ ID:12287, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42750] Another function of VGAM1189 is therefore inhibition of OS4 (Accession NM_005730). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with OS4.

P17.3 (Accession NM_019056) is another VGAM1189 host target gene. P17.3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by P17.3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P17.3 BINDING SITE, designated SEQ ID:21138, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42751] Another function of VGAM1189 is therefore inhibition of P17.3 (Accession NM_019056). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P17.3. p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168) is another VGAM1189 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:21389,

to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42752] Another function of VGAM1189 is therefore inhibition of p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. Phospholipase A2, Group VI (cytosolic, calcium-independent) (PLA2G6, Accession XM_039248) is another VGAM1189 host target gene. PLA2G6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G6 BINDING SITE, designated SEQ ID:33030, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42753] Another function of VGAM1189 is therefore inhibition of Phospholipase A2, Group VI (cytosolic, calcium-independent) (PLA2G6, Accession XM_039248). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with PLA2G6. Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM_117531) is another VGAM1189 host target gene. PRKWNK2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRKWNK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWNK2 BINDING SITE, designated SEQ ID:43519, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42754] Another function of VGAM1189 is therefore inhibition of Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM_117531). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2. Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM_133177) is another VGAM1189 host target gene. PTPRU BINDING SITE1 through PTPRU BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of PTPRU BINDING SITE1 through PTPRU BINDING SITE3, designated SEQ ID:28399, SEQ ID:28404 and SEQ ID:12254 respectively, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42755] Another function of VGAM1189 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, U (PTPRU, Accession NM_133177). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRU. SEC61A1 (Accession NM_013336) is another VGAM1189 host target gene. SEC61A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC61A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC61A1 BINDING SITE, designated SEQ ID:14983, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42756] Another function of VGAM1189 is therefore inhibition of SEC61A1 (Accession NM_013336). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SEC61A1. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379) is another VGAM1189 host target gene. SEMA3C BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEMA3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3C BINDING SITE, designated SEQ ID:13072, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42757] Another function of VGAM1189 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3C. Stathmin-like 3 (STMN3, Accession NM_015894) is another VGAM1189 host target gene. STMN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STMN3, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STMN3 BINDING SITE, designated SEQ ID:18037, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42758] Another function of VGAM1189 is therefore inhibition of Stathmin-like 3 (STMN3, Accession NM_015894). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STMN3. LOC115051 (Accession XM_010647) is another VGAM1189 host target gene. LOC115051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115051 BINDING SITE, designated SEQ ID:30158, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42759] Another function of VGAM1189 is therefore inhibition of LOC115051 (Accession XM_010647). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC115051. LOC144114 (Accession XM_090198) is another VGAM1189 host target gene. LOC144114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144114 BINDING SITE, designated SEQ ID:39994, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42760] Another function of VGAM1189 is therefore inhibition of LOC144114 (Accession XM_090198). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144114. LOC146268 (Accession XM_085397) is another VGAM1189 host target gene. LOC146268 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146268 BINDING SITE, designated SEQ ID:38120, to

the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42761] Another function of VGAM1189 is therefore inhibition of LOC146268 (Accession XM_085397). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146268. LOC146488 (Accession XM_047748) is another VGAM1189 host target gene. LOC146488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:35042, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42762] Another function of VGAM1189 is therefore inhibition of LOC146488 (Accession XM_047748). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC146895 (Accession XM_097120) is another VGAM1189 host target gene. LOC146895 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC146895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146895 BINDING SITE, designated SEQ ID:40759, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42763] Another function of VGAM1189 is therefore inhibition of LOC146895 (Accession XM_097120). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146895. LOC157349 (Accession XM_088298) is another VGAM1189 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39589, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42764] Another function of VGAM1189 is therefore inhibition of LOC157349 (Accession XM_088298). Accordingly, utilities

of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC159090 (Accession XM_088749) is another VGAM1189 host target gene. LOC159090 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159090 BINDING SITE, designated SEQ ID:39939, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42765] Another function of VGAM1189 is therefore inhibition of LOC159090 (Accession XM_088749). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159090. LOC196500 (Accession XM_113734) is another VGAM1189 host target gene. LOC196500 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196500 BINDING SITE, designated SEQ ID:42388, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42766] Another function of VGAM1189 is therefore inhibition of LOC196500 (Accession XM_113734). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196500. LOC199786 (Accession XM_114021) is another VGAM1189 host target gene. LOC199786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199786 BINDING SITE, designated SEQ ID:42617, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42767] Another function of VGAM1189 is therefore inhibition of LOC199786 (Accession XM_114021). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786. LOC199800 (Accession XM_117134) is another VGAM1189 host target gene. LOC199800 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199800 BINDING SITE, designated SEQ ID:43249, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42768] Another function of VGAM1189 is therefore inhibition of LOC199800 (Accession XM_117134). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199800. LOC200093 (Accession XM_032184) is another VGAM1189 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31597, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42769] Another function of VGAM1189 is therefore inhibition of

LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC201245 (Accession XM_113326) is another VGAM1189 host target gene. LOC201245 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201245 BINDING SITE, designated SEQ ID:42229, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42770] Another function of VGAM1189 is therefore inhibition of LOC201245 (Accession XM_113326). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201245. LOC205095 (Accession XM_119820) is another VGAM1189 host target gene. LOC205095 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC205095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC205095 BINDING SITE, designated SEQ ID:43603, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42771] Another function of VGAM1189 is therefore inhibition of LOC205095 (Accession XM_119820). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205095. LOC219513 (Accession XM_169166) is another VGAM1189 host target gene. LOC219513 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:45291, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42772] Another function of VGAM1189 is therefore inhibition of LOC219513 (Accession XM_169166). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219513. LOC221424 (Accession XM_168060) is an-

other VGAM1189 host target gene. LOC221424 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221424 BINDING SITE, designated SEQ ID:44977, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42773] Another function of VGAM1189 is therefore inhibition of LOC221424 (Accession XM_168060). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221424. LOC222183 (Accession XM_168436) is another VGAM1189 host target gene. LOC222183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222183 BINDING SITE, designated SEQ ID:45183, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42774] Another function of VGAM1189 is therefore inhibition of LOC222183 (Accession XM_168436). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222183. LOC256867 (Accession XM_170694) is another VGAM1189 host target gene. LOC256867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256867 BINDING SITE, designated SEQ ID:45471, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42775] Another function of VGAM1189 is therefore inhibition of LOC256867 (Accession XM_170694). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256867. LOC257451 (Accession XM_170960) is another VGAM1189 host target gene. LOC257451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257451, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257451 BINDING SITE, designated SEQ ID:45741, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42776] Another function of VGAM1189 is therefore inhibition of LOC257451 (Accession XM_170960). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257451. LOC90768 (Accession XM_033986) is another VGAM1189 host target gene. LOC90768 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90768 BINDING SITE, designated SEQ ID:31986, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42777] Another function of VGAM1189 is therefore inhibition of LOC90768 (Accession XM_033986). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90768. LOC91040 (Accession XM_035641) is another VGAM1189 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32315, to the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, also designated SEQ ID:3900.

[42778] Another function of VGAM1189 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. LOC91149 (Accession XM_036480) is another VGAM1189 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32455, to the nucleotide sequence of VGAM1189 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3900.

[42779] Another function of VGAM1189 is therefore inhibition of LOC91149 (Accession XM_036480). Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1190 (VGAM1190) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42780] VGAM1190 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1190 was detected is described hereinabove with reference to Figs. 1–8.

[42781] VGAM1190 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Botrytis Virus F. VGAM1190 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42782] VGAM1190 gene encodes a VGAM1190 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1190 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1190 precursor RNA is designated SEQ ID:1176, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1176 is located at position 2147 relative to the genome of Botrytis Virus F.

[42783] VGAM1190 precursor RNA folds onto itself, forming VGAM1190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42784] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1190 folded precursor RNA into VGAM1190 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1190 RNA is designated SEQ ID:3901, and is provided hereinbelow with reference to the sequence listing part.

[42785] VGAM1190 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1190 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42786] VGAM1190 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1190 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1190 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[42787] The complementary binding of VGAM1190 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1190 host target RNA into VGAM1190 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42788] It is appreciated that VGAM1190 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1190 host target genes. The mRNA of

each one of this plurality of VGAM1190 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1190 RNA, herein designated VGAM RNA, and which when bound by VGAM1190 RNA causes inhibition of translation of respective one or more VGAM1190 host target proteins.

[42789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1190 gene, herein designated VGAM GENE, on one or more VGAM1190 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[42790] It is yet further appreciated that a function of VGAM1190 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1190 include diagnosis, prevention and treatment of viral infection by Botrytis Virus F. Specific functions, and accordingly utilities, of VGAM1190 correlate with, and may be deduced from, the identity of the host target genes which VGAM1190 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42791] Nucleotide sequences of the VGAM1190 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1190 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1190 are further described hereinbelow with reference to Table 1.

[42792] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1190 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1190 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42793] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1190 gene, herein designated VGAM is inhibition of expression of VGAM1190 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1190 correlate with, and may be deduced from, the identity of the target genes which VGAM1190 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42794] BIG1 (Accession NM_006421) is a VGAM1190 host target gene. BIG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BIG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIG1 BINDING SITE, designated SEQ ID:13136, to the nucleotide sequence of VGAM1190 RNA, herein designated VGAM RNA, also designated SEQ ID:3901.

[42795] A function of VGAM1190 is therefore inhibition of BIG1 (Accession NM_006421), a gene which is a guanine nucleotide-exchange protein, has a role in vesicular transport. Accordingly, utilities of VGAM1190 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with BIG1. The function of BIG1 has been established by previous studies. After peptide sequencing of purified bovine p200, Togawa et al. (1999) used PCR generated probes to screen a human frontal cortex cDNA library and isolated BIG1 and BIG2 (OMIM Ref. No. 605371) cDNAs. The assembled full-length BIG1 cDNA encodes a protein of 1,849 amino acids containing a Sec7 domain characteristic of ARF guanine nucleotide-exchange proteins. BIG1 shares 74% overall amino acid identity with BIG2 and 90% identity in the Sec7 domain. Using Northern blot analysis, Togawa et al. (1999) detected a 7.5-kb BIG1 transcript in placenta and lung. Weaker expression was detected in heart, brain, kidney, and pancreas. Mansour et al. (1999) studied the ubiquitously expressed ARFGEP1 protein and proposed that accumulation of an abortive p200-ARF complex in the presence of BFA likely leads to disruption of Golgi morphology. Database searches revealed the presence of putative isoforms whose inhibition may account for the effects of BFA on various organelles.

[42796] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [42797] Togawa, A.; Morinaga, N.; Ogasawara, M.; Moss, J.; Vaughan, M. : Purification and cloning of a brefeldin A-inhibited guanine nucleotide-exchange protein for ADP-ribosylation factors. J. Biol. Chem. 274: 12308-12315, 1999. ; and
- [42798] Mansour, S. J.; Skaug, J.; Zhao, X.-H.; Giordano, J.; Scherer, S. W.; Melancon, P. : p200 ARF-GEP1: a Golgi-localized guanine nucleotide exchange protein whose Sec7 domain is targeted b.
- [42799] Further studies establishing the function and utilities of BIG1 are found in John Hopkins OMIM database record ID 604141, and in cited publications numbered 4443-4446 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Channel, Subfamily K, Member 6 (KCNK6, Accession NM_004823) is another VGAM1190 host target gene. KCNK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK6 BINDING SITE, designated SEQ ID:11238, to the

nucleotide sequence of VGAM1190 RNA, herein designated VGAM RNA, also designated SEQ ID:3901.

[42800] Another function of VGAM1190 is therefore inhibition of Potassium Channel, Subfamily K, Member 6 (KCNK6, Accession NM_004823), a gene which is an inward rectifying potassium channel protein. Accordingly, utilities of VGAM1190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK6. The function of KCNK6 has been established by previous studies. Potassium channels perform many distinct functions in both excitable and nonexcitable cells. Members of the tandem pore domain potassium (K2P) channel family, such as TWIK1 (OMIM Ref. No. 601745) and TREK (OMIM Ref. No. 603219), contain 4 transmembrane domains and 2 pore-forming (P) domains. The K2P channels all produce quasi-instantaneous and noninactivating currents but exhibit different types of regulation, indicating that these potassium channels are probably involved in a great diversity of physiologic and pathophysiologic roles (Salinas et al., 1999). Both Chavez et al. (1999) and Pountney et al. (1999) identified cDNAs encoding human KCNK6, which they referred to as TWIK2 and TOSS (TWIK-originated similarity sequence), respectively. Chavez et al. (1999) re-

ported that the predicted 313-amino acid TWIK2 protein shares 54% sequence similarity with TWIK1. Pountney et al. (1999) stated that since TOSS lacks a signal sequence, the N terminus is predicted to be intracellular. They noted that the P2 domain of TOSS contains an unusual GLG motif in a position corresponding to that found in TWIK1. While Chavez et al. (1999) found by Northern blot analysis that the 6.8-, 2.6-, and 1.35-kb TWIK2 mRNAs were expressed in many human tissues, Pountney et al. (1999) reported a more restricted expression pattern. In *Xenopus* oocytes expressing TWIK2, Chavez et al. (1999) detected noninactivating, weak inward rectification, while Pountney et al. (1999) failed to detect any currents above background. By radiation hybrid analysis, Gray et al. (1999) mapped the KCNK6 gene to chromosome 19q13.1.

[42801] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42802] Chavez, R. A.; Gray, A. T.; Zhao, B. B.; Kindler, C. H.; Mazurek, M. J.; Mehta, Y.; Forsayeth, J. R.; Yost, C. S. : TWIK-2, a new weak inward rectifying member of the tandem pore domain potassium channel family. *J. Biol. Chem.* 274: 7887-7892, 1999. ; and

[42803] Gray, A. T.; Kindler, C. H.; Sampson, E. R.; Yost, C. S. : Assignment of KCNK6 encoding the human weak inward rectifier potassium channel TWIK-2 to chromosome band 19q13.1 by radiation.

[42804] Further studies establishing the function and utilities of KCNK6 are found in John Hopkins OMIM database record ID 603939, and in cited publications numbered 5039-5042 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leucine Zipper, Down-regulated In Cancer 1 (LDOC1, Accession NM_012317) is another VGAM1190 host target gene. LDOC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LDOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDOC1 BINDING SITE, designated SEQ ID:14691, to the nucleotide sequence of VGAM1190 RNA, herein designated VGAM RNA, also designated SEQ ID:3901.

[42805] Another function of VGAM1190 is therefore inhibition of Leucine Zipper, Down-regulated In Cancer 1 (LDOC1, Accession NM_012317). Accordingly, utilities of VGAM1190

include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDOC1. MGC27382 (Accession NM_144700) is another VGAM1190 host target gene. MGC27382 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC27382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC27382 BINDING SITE, designated SEQ ID:29524, to the nucleotide sequence of VGAM1190 RNA, herein designated VGAM RNA, also designated SEQ ID:3901.

[42806] Another function of VGAM1190 is therefore inhibition of MGC27382 (Accession NM_144700). Accordingly, utilities of VGAM1190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27382. MIG (Accession NM_002416) is another VGAM1190 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, design-

nated SEQ ID:8244, to the nucleotide sequence of VGAM1190 RNA, herein designated VGAM RNA, also designated SEQ ID:3901.

[42807] Another function of VGAM1190 is therefore inhibition of MIG (Accession NM_002416). Accordingly, utilities of VGAM1190 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG. Stromal Cell Derived Factor Receptor 1 (SDFR1, Accession NM_012428) is another VGAM1190 host target gene. SDFR1 BINDING SITE1 and SDFR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SDFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDFR1 BINDING SITE1 and SDFR1 BINDING SITE2, designated SEQ ID:14802 and SEQ ID:18929 respectively, to the nucleotide sequence of VGAM1190 RNA, herein designated VGAM RNA, also designated SEQ ID:3901.

[42808] Another function of VGAM1190 is therefore inhibition of Stromal Cell Derived Factor Receptor 1 (SDFR1, Accession NM_012428). Accordingly, utilities of VGAM1190 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with SDFR1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1191 (VGAM1191) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42809] VGAM1191 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1191 was detected is described hereinabove with reference to Figs. 1–8.

[42810] VGAM1191 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Botrytis Virus F. VGAM1191 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42811] VGAM1191 gene encodes a VGAM1191 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1191 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1191 precursor RNA is designated SEQ ID:1177, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1177 is located at position 5016 relative to the genome of Botrytis Virus F.

- [42812] VGAM1191 precursor RNA folds onto itself, forming VGAM1191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [42813] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1191 folded precursor RNA into VGAM1191 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1191 RNA is designated SEQ ID:3902, and is provided hereinbelow with reference to the sequence listing part.

[42814] VGAM1191 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1191 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42815] VGAM1191 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1191 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1191 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42816] The complementary binding of VGAM1191 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1191 host target RNA into VGAM1191 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42817] It is appreciated that VGAM1191 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1191 host target genes. The mRNA of each one of this plurality of VGAM1191 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1191 RNA, herein designated VGAM RNA, and which when bound by VGAM1191 RNA causes

inhibition of translation of respective one or more VGAM1191 host target proteins.

[42818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1191 gene, herein designated VGAM GENE, on one or more VGAM1191 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42819] It is yet further appreciated that a function of VGAM1191 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1191 include diagnosis, prevention and

treatment of viral infection by Botrytis Virus F. Specific functions, and accordingly utilities, of VGAM1191 correlate with, and may be deduced from, the identity of the host target genes which VGAM1191 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42820] Nucleotide sequences of the VGAM1191 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1191 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1191 are further described hereinbelow with reference to Table 1.

[42821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1191 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1191 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42822] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1191 gene, herein designated VGAM is inhibition of expression of VGAM1191 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1191 correlate with, and may be deduced from, the identity of the target genes which VGAM1191 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42823] Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM_022162) is a VGAM1191 host target gene. CARD15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD15 BINDING SITE, designated SEQ ID:22715, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42824] A function of VGAM1191 is therefore inhibition of Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM_022162), a gene which serves as an intracellular receptor for bacterial products in monocytes and transduces signals leading to NFkB activation. Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with CARD15. The function of CARD15 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM126. Huntingtin

(Huntington disease) (HD, Accession NM_002111) is another VGAM1191 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7899, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42825] Another function of VGAM1191 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession NM_002111). Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. LIM Domain Kinase 1 (LIMK1, Accession NM_016735) is another VGAM1191 host target gene. LIMK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIMK1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE, designated SEQ ID:18802, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42826] Another function of VGAM1191 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_016735). Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM_003149) is another VGAM1191 host target gene. STAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAC BINDING SITE, designated SEQ ID:9117, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42827] Another function of VGAM1191 is therefore inhibition of Src Homology Three (SH3) and Cysteine Rich Domain

(STAC, Accession NM_003149), a gene which is probably involved in a neuron-specific signal transduction. Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAC. The function of STAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331. Stromal Interaction Molecule 1 (STIM1, Accession XM_011967) is another VGAM1191 host target gene. STIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIM1 BINDING SITE, designated SEQ ID:30201, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42828] Another function of VGAM1191 is therefore inhibition of Stromal Interaction Molecule 1 (STIM1, Accession XM_011967), a gene which is very strongly similar to murine Stim1 and may be a transmembrane stromal cell protein. Accordingly, utilities of VGAM1191 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with STIM1. The function of STIM1 has been established by previous studies. Using sequences identified by database searching with a transcript from human chromosome 11p15.5, Parker et al. (1996) screened placental and fetal liver cDNA libraries and cloned a novel cDNA, STIM1, which they called GOK. The deduced 746-amino acid protein contains a predicted signal peptide and transmembrane helix. Parker et al. (1996) also cloned a partial mouse Stim1 genomic clone and found that the human and mouse proteins share 90% sequence identity. Restriction mapping by pulsed field electrophoresis placed the STIM1 gene 1.7 kb telomeric of the RRM1 gene (OMIM Ref. No. 180410) on 11p15.5 (Parker et al., 1996). Sabbioni et al. (1999) determined that the STIM1 gene contains 12 exons that span more than 250 kb between the RRM1 and NUP98 (OMIM Ref. No. 601021) genes.

[42829] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42830] Parker, N. J.; Begley, C. G.; Smith, P. J.; Fox, R. M. : Molecular cloning of a novel human gene (D11S4896E) at chro-

mosomal region 11p15.5. Genomics 37: 253–256, 1996. ;
and

[42831] Sabbioni, S.; Veronese, A.; Trubia, M.; Taramelli, R.; Barbanti-Brodano, G.; Croce, C. M.; Negrini, M. : Exon structure and promoter identification of STIM1 (alias GOK), a human gene ca.

[42832] Further studies establishing the function and utilities of STIM1 are found in John Hopkins OMIM database record ID 605921, and in cited publications numbered 6438–6439 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BMF (Accession NM_033503) is another VGAM1191 host target gene. BMF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BMF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:27283, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42833] Another function of VGAM1191 is therefore inhibition of BMF (Accession NM_033503). Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with BMF. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_003671) is another VGAM1191 host target gene. CDC14B BINDING SITE1 and CDC14B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDC14B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE1 and CDC14B BINDING SITE2, designated SEQ ID:9760 and SEQ ID:27164 respectively, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42834] Another function of VGAM1191 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_003671). Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. MGC12992 (Accession NM_032342) is another VGAM1191 host target gene. MGC12992 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC12992, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12992 BINDING SITE, designated SEQ ID:26136, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42835] Another function of VGAM1191 is therefore inhibition of MGC12992 (Accession NM_032342). Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12992. Tripartite Motif-containing 2 (TRIM2, Accession NM_015271) is another VGAM1191 host target gene. TRIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM2 BINDING SITE, designated SEQ ID:17603, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42836] Another function of VGAM1191 is therefore inhibition of Tripartite Motif-containing 2 (TRIM2, Accession NM_015271). Accordingly, utilities of VGAM1191 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM2. LOC92080 (Accession XM_042704) is another VGAM1191 host target gene. LOC92080 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92080 BINDING SITE, designated SEQ ID:33757, to the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, also designated SEQ ID:3902.

[42837] Another function of VGAM1191 is therefore inhibition of LOC92080 (Accession XM_042704). Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92080. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1192 (VGAM1192) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42838] VGAM1192 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1192 was detected is described hereinabove with reference to Figs. 1-8.

[42839] VGAM1192 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1192 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42840] VGAM1192 gene encodes a VGAM1192 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1192 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1192 precursor RNA is designated SEQ ID:1178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1178 is located at position 37365 relative to the genome of Cowpox Virus.

[42841] VGAM1192 precursor RNA folds onto itself, forming VGAM1192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42842] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1192 folded precursor RNA into VGAM1192 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1192 RNA is designated SEQ ID:3903, and is provided hereinbelow with reference to the sequence listing part.

[42843] VGAM1192 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1192 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[42844] VGAM1192 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1192 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1192 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42845] The complementary binding of VGAM1192 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1192 host target RNA into VGAM1192 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42846] It is appreciated that VGAM1192 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1192 host target genes. The mRNA of each one of this plurality of VGAM1192 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1192 RNA, herein designated VGAM RNA, and which when bound by VGAM1192 RNA causes inhibition of translation of respective one or more VGAM1192 host target proteins.

[42847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1192 gene, herein designated VGAM GENE, on one or more VGAM1192 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42848] It is yet further appreciated that a function of VGAM1192 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1192 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1192 correlate with, and may be deduced from, the identity of the host target genes which VGAM1192 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42849] Nucleotide sequences of the VGAM1192 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1192 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1192 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1192 are further
described hereinbelow with reference to Table 1.

[42850] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1192 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1192 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[42851] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1192 gene, herein designated VGAM is
inhibition of expression of VGAM1192 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1192 correlate with, and may be deduced
from, the identity of the target genes which VGAM1192
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[42852] FLJ12888 (Accession NM_024945) is a VGAM1192 host
target gene. FLJ12888 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ12888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12888 BINDING SITE, designated SEQ ID:24495, to the nucleotide sequence of VGAM1192 RNA, herein designated VGAM RNA, also designated SEQ ID:3903.

[42853] A function of VGAM1192 is therefore inhibition of FLJ12888 (Accession NM_024945). Accordingly, utilities of VGAM1192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12888. FLJ22794 (Accession XM_166220) is another VGAM1192 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44032, to the nucleotide sequence of VGAM1192 RNA, herein designated VGAM RNA, also designated SEQ ID:3903.

[42854] Another function of VGAM1192 is therefore inhibition of

FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM1192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. MEP50 (Accession NM_024102) is another VGAM1192 host target gene. MEP50 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEP50, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEP50 BINDING SITE, designated SEQ ID:23547, to the nucleotide sequence of VGAM1192 RNA, herein designated VGAM RNA, also designated SEQ ID:3903.

[42855] Another function of VGAM1192 is therefore inhibition of MEP50 (Accession NM_024102). Accordingly, utilities of VGAM1192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEP50. LOC256846 (Accession XM_170921) is another VGAM1192 host target gene. LOC256846 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC256846 BINDING SITE, designated SEQ ID:45698, to the nucleotide sequence of VGAM1192 RNA, herein designated VGAM RNA, also designated SEQ ID:3903.

[42856] Another function of VGAM1192 is therefore inhibition of LOC256846 (Accession XM_170921). Accordingly, utilities of VGAM1192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256846. LOC90355 (Accession NM_033211) is another VGAM1192 host target gene. LOC90355 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90355 BINDING SITE, designated SEQ ID:27062, to the nucleotide sequence of VGAM1192 RNA, herein designated VGAM RNA, also designated SEQ ID:3903.

[42857] Another function of VGAM1192 is therefore inhibition of LOC90355 (Accession NM_033211). Accordingly, utilities of VGAM1192 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90355. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1193 (VGAM1193) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42858] VGAM1193 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1193 was detected is described hereinabove with reference to Figs. 1–8.

[42859] VGAM1193 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM1193 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42860] VGAM1193 gene encodes a VGAM1193 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1193 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1193 precursor RNA is designated SEQ ID:1179, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1179 is located at position 26098 relative to the genome of Vaccinia Virus.

[42861] VGAM1193 precursor RNA folds onto itself, forming VGAM1193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42862] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1193 folded precursor RNA into VGAM1193 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1193 RNA is designated SEQ ID:3904, and is provided hereinbelow with reference to the sequence listing part.

[42863] VGAM1193 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1193 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42864] VGAM1193 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1193 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1193 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1193 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[42865] The complementary binding of VGAM1193 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1193 host target RNA into VGAM1193 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42866] It is appreciated that VGAM1193 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1193 host target genes. The mRNA of each one of this plurality of VGAM1193 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1193 RNA, herein designated VGAM RNA, and which when bound by VGAM1193 RNA causes inhibition of translation of respective one or more

VGAM1193 host target proteins.

[42867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1193 gene, herein designated VGAM GENE, on one or more VGAM1193 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42868] It is yet further appreciated that a function of VGAM1193 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1193 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM1193 correlate with, and may be deduced from, the identity of the host target genes which VGAM1193 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42869] Nucleotide sequences of the VGAM1193 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1193 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1193 are further described hereinbelow with reference to Table 1.

[42870] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1193 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1193 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42871] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1193 gene, herein designated VGAM is inhibition of expression of VGAM1193 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1193 correlate with, and may be deduced from, the identity of the target genes which VGAM1193 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42872] Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM_003038) is a VGAM1193 host target gene. SLC1A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:8997, to the nucleotide sequence of VGAM1193 RNA, herein designated VGAM RNA, also designated SEQ ID:3904.

[42873] A function of VGAM1193 is therefore inhibition of Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM_003038), a gene which transports alanine, serine, cysteine, and threonine. exhibits sodium dependence. Accordingly, utilities of VGAM1193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A4. The function of SLC1A4 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM859.BC008967 (Accession XM_027309) is another VGAM1193 host target gene. BC008967 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BC008967, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BC008967 BINDING SITE, designated SEQ ID:30476, to the nucleotide sequence of VGAM1193 RNA, herein designated VGAM RNA, also designated SEQ ID:3904.

[42874] Another function of VGAM1193 is therefore inhibition of BC008967 (Accession XM_027309). Accordingly, utilities of VGAM1193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BC008967. LOC158722 (Accession XM_088653) is another VGAM1193 host target gene. LOC158722 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158722 BINDING SITE, designated SEQ ID:39889, to the nucleotide sequence of VGAM1193 RNA, herein designated VGAM RNA, also designated SEQ ID:3904.

[42875] Another function of VGAM1193 is therefore inhibition of LOC158722 (Accession XM_088653). Accordingly, utilities of VGAM1193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158722. LOC91650 (Accession XM_039853) is another VGAM1193 host target gene. LOC91650 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91650 BINDING SITE, designated SEQ ID:33200, to the nucleotide sequence of VGAM1193 RNA, herein designated VGAM RNA, also designated SEQ ID:3904.

[42876] Another function of VGAM1193 is therefore inhibition of LOC91650 (Accession XM_039853). Accordingly, utilities of VGAM1193 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91650. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1194 (VGAM1194) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42877] VGAM1194 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1194 was detected is described hereinabove with reference to Figs. 1–8.

[42878] VGAM1194 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1194 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42879] VGAM1194 gene encodes a VGAM1194 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1194 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1194 precursor RNA is designated SEQ ID:1180, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1180 is located at position 25686 relative to the

genome of Camelpox Virus.

[42880] VGAM1194 precursor RNA folds onto itself, forming VGAM1194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1194 folded precursor RNA into VGAM1194 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1194 RNA is designated SEQ ID:3905, and is provided hereinbelow with reference to the sequence listing part.

[42882] VGAM1194 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1194 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42883] VGAM1194 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1194 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1194 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42884] The complementary binding of VGAM1194 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1194 host target RNA into VGAM1194 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42885] It is appreciated that VGAM1194 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1194 host target genes. The mRNA of each one of this plurality of VGAM1194 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1194 RNA, herein designated VGAM RNA, and which when bound by VGAM1194 RNA causes inhibition of translation of respective one or more VGAM1194 host target proteins.

[42886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1194 gene, herein designated VGAM GENE, on one or more VGAM1194 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42887] It is yet further appreciated that a function of VGAM1194 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1194 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1194 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1194 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42888] Nucleotide sequences of the VGAM1194 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1194 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1194 are further described hereinbelow with reference to Table 1.

[42889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1194 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1194 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1194 gene, herein designated VGAM is inhibition of expression of VGAM1194 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1194 correlate with, and may be deduced

from, the identity of the target genes which VGAM1194 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42891] Ectodermal Dysplasia 1, Anhidrotic (ED1, Accession NM_001399) is a VGAM1194 host target gene. ED1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ED1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ED1 BINDING SITE, designated SEQ ID:7101, to the nucleotide sequence of VGAM1194 RNA, herein designated VGAM RNA, also designated SEQ ID:3905.

[42892] A function of VGAM1194 is therefore inhibition of Ectodermal Dysplasia 1, Anhidrotic (ED1, Accession NM_001399). Accordingly, utilities of VGAM1194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ED1. Oxidative-stress Responsive 1 (OSR1, Accession NM_005109) is another VGAM1194 host target gene. OSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:11590, to the nucleotide sequence of VGAM1194 RNA, herein designated VGAM RNA, also designated SEQ ID:3905.

[42893] Another function of VGAM1194 is therefore inhibition of Oxidative-stress Responsive 1 (OSR1, Accession NM_005109), a gene which mediates stress-activated signals. Accordingly, utilities of VGAM1194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1. The function of OSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_138325) is another VGAM1194 host target gene. PACE4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PACE4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:28726, to the nucleotide sequence of VGAM1194 RNA,

herein designated VGAM RNA, also designated SEQ ID:3905.

[42894] Another function of VGAM1194 is therefore inhibition of Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_138325), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of VGAM1194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4. The function of PACE4 has been established by previous studies. Using PCR methods, Kiefer et al. (1991) identified a second human subtilisin-like protease gene on chromosome 15. PCR primers were designed to be specific for the subfamily of eukaryotic subtilisin-like proteases with specificity for paired basic amino acid residue processing motifs. The gene encoding this protease, designated PACE4, also encoded a smaller subtilisin-related polypeptide derived by alternative mRNA splicing. As with the product of the PACE gene (OMIM Ref. No. 136950), the tissue distribution of PACE4 was widespread, with comparatively higher levels in the liver. By in situ hybridization using isolated cosmid clones, Kiefer et al. (1991) mapped the PACE4 gene to chromosome 15 in close proximity to the PACE gene at

15q25–q26. Double labeling in situ hybridization suggested that the 2 genes are within 5 megabases of each other. Mbikay et al. (1995) mapped the gene for PACE4 (Pcsk6) to mouse chromosome 7 by RFLP analysis of a DNA panel from an interspecific backcross. It was located at a distance of 13 cM from the Pcsk3 locus, which specifies furin (OMIM Ref. No. 136950), another member of this family of enzymes previously mapped to mouse chromosome 7. This is in concordance with the known close proximity of these 2 loci in the homologous region on human 15q25–qter. Pcsk3 and Pcsk6 map to a region of mouse chromosome 7 that has been associated cytogenetically with postnatal lethality in maternal disomy, suggesting that these genes may be imprinted.

[42895] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42896] Kiefer, M. C.; Tucker, J. E.; Joh, R.; Landsberg, K. E.; Saltman, D.; Barr, P. J. : Identification of a second human subtilisin-like protease gene in the fes/fps region of chromosome 15. DNA Cell Biol. 10: 757–769, 1991. ; and

[42897] Mbikay, M.; Seidah, N. G.; Chretien, M.; Simpson, E. M. : Chromosomal assignment of the genes for proprotein

convertases PC4, PC5, and PACE 4 in mouse and human. Genomics 26: 123–129, 19.

[42898] Further studies establishing the function and utilities of PACE4 are found in John Hopkins OMIM database record ID 167405, and in cited publications numbered 10330 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1462 (Accession XM_166132) is another VGAM1194 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:43921, to the nucleotide sequence of VGAM1194 RNA, herein designated VGAM RNA, also designated SEQ ID:3905.

[42899] Another function of VGAM1194 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM1194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. LOC145945 (Accession XM_096908) is another VGAM1194 host target gene. LOC145945 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40636, to the nucleotide sequence of VGAM1194 RNA, herein designated VGAM RNA, also designated SEQ ID:3905.

[42900] Another function of VGAM1194 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM1194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC219401 (Accession XM_166706) is another VGAM1194 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44595, to the nucleotide sequence of VGAM1194 RNA, herein designated VGAM RNA, also designated SEQ ID:3905.

[42901] Another function of VGAM1194 is therefore inhibition of

LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM1194 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1195 (VGAM1195) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42902] VGAM1195 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1195 was detected is described hereinabove with reference to Figs. 1-8.

[42903] VGAM1195 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1195 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42904] VGAM1195 gene encodes a VGAM1195 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1195 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1195 precursor RNA is designated SEQ ID:1181, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1181 is located at position 79725 relative to the genome of Equine Herpesvirus 1.

- [42905] VGAM1195 precursor RNA folds onto itself, forming VGAM1195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [42906] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1195 folded precursor RNA into VGAM1195 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1195 RNA is designated SEQ ID:3906, and is provided hereinbelow with reference to the sequence listing part.

[42907] VGAM1195 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1195 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42908] VGAM1195 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1195 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1195 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[42909] The complementary binding of VGAM1195 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1195 host target RNA into VGAM1195 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42910] It is appreciated that VGAM1195 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1195 host target genes. The mRNA of each one of this plurality of VGAM1195 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1195 RNA, herein designated VGAM RNA, and which when bound by VGAM1195 RNA causes inhibition of translation of respective one or more VGAM1195 host target proteins.

[42911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1195 gene, herein designated VGAM GENE, on one or more VGAM1195 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42912] It is yet further appreciated that a function of VGAM1195

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1195 correlate with, and may be deduced from, the identity of the host target genes which VGAM1195 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42913] Nucleotide sequences of the VGAM1195 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1195 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1195 are further described hereinbelow with reference to Table 1.

[42914] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1195 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1195 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42915] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1195 gene, herein designated VGAM is inhibition of expression of VGAM1195 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1195 correlate with, and may be deduced from, the identity of the target genes which VGAM1195 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42916] Dihydrofolate Reductase (DHFR, Accession NM_000791) is a VGAM1195 host target gene. DHFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DHFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:6445, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42917] A function of VGAM1195 is therefore inhibition of Dihydrofolate Reductase (DHFR, Accession NM_000791), a gene which converts dihydrofolate into tetrahydrofolate. Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with DHFR. The function of DHFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM826.Ems1 Sequence (mammary tumor and squamous cell carcinoma-associated (p80/85 src substrate) (EMS1, Accession NM_005231) is another VGAM1195 host target gene. EMS1 BINDING SITE1 and EMS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EMS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMS1 BINDING SITE1 and EMS1 BINDING SITE2, designated SEQ ID:11734 and SEQ ID:28865 respectively, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42918] Another function of VGAM1195 is therefore inhibition of Ems1 Sequence (mammary tumor and squamous cell carcinoma-associated (p80/85 src substrate) (EMS1, Accession NM_005231), a gene which may contribute to the organization of cell structure. in transformed cells may contribute to cellular growth regulation and transformation.

Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMS1. The function of EMS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497. Transcription Factor CP2 (TFCP2, Accession NM_005653) is another VGAM1195 host target gene. TFCP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TFCP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFCP2 BINDING SITE, designated SEQ ID:12192, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42919] Another function of VGAM1195 is therefore inhibition of Transcription Factor CP2 (TFCP2, Accession NM_005653), a gene which is a transcription factor CP2 and recognizes sites within the alpha-globin gene and SV40 late promoters. Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFCP2. The function of TFCP2 has

been established by previous studies. Lambert et al. (2000) reported an association between a noncoding polymorphism (G-A) in the 3-prime untranslated region of TFCP2 and sporadic Alzheimer disease (AD5; 602096) in French and British populations and a similar trend in a North American population. The combined analysis of the 3 independent populations suggested a protective effect of the A allele (OR = 0.58, 95% CI 0.44–0.75). The A allele demonstrated reduced binding to nuclear protein(s) from a neuroblastoma cell line, and absence of the A allele was associated with lower gene expression in lymphocytes from AD cases compared with controls. The authors suggested that polymorphic variation in TFCP2 may be important for the pathogenesis of AD, particularly since the gene product interacts with proteins such as GSK3B (OMIM Ref. No. 605004), Fe65 (OMIM Ref. No. 602709), and certain factors involved in the inflammatory response. Swendeman et al. (1994) characterized the genomic structure, chromosome location, promoter, and expression pattern of CP2, a 66-kD cellular transcription factor that interacts with the alpha-globin (OMIM Ref. No. 141800) promoter as well as with additional cellular and viral promoter elements. Homodimers of CP2, together with a 45-kD part-

ner protein, form the so-called stage selector protein complex (Jane et al., 1995) that binds to a proximal gamma-globin gene promoter regulatory sequence, termed the stage selector element (SSE). The SSE is thought to be involved in silencing beta globin gene (OMIM Ref. No. 141900) transcription during fetal erythropoiesis (Cunningham et al., 1995).

[42920] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[42921] Swendeman, S. L.; Spielholz, C.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Sheffery, M. : Characterization of the genomic structure, chromosomal location, promoter, and developmental expression of the alpha-globin transcription factor CP2. J. Biol. Chem. 269: 11663–11671, 1994. ; and

[42922] Lambert, J.-C.; Goumidi, L.; Wavrant-De Vrieze, F.; Frigard, B.; Harris, J. M.; Cummings, A.; Coates, J.; Pasquier, F.; Cotel, D.; Gaillac, M.; St. Clair, D.; Mann, D. M. A.; Hardy, J.;

[42923] Further studies establishing the function and utilities of TFCEP2 are found in John Hopkins OMIM database record ID 189889, and in cited publications numbered

12343–1234 and 12346–12348 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Wolf–Hirschhorn Syndrome Candidate 1–like 1 (WHSC1L1, Accession NM_017778) is another VGAM1195 host target gene. WHSC1L1 BINDING SITE1 and WHSC1L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1L1 BINDING SITE1 and WHSC1L1 BINDING SITE2, designated SEQ ID:19408 and SEQ ID:23315 respectively, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42924] Another function of VGAM1195 is therefore inhibition of Wolf–Hirschhorn Syndrome Candidate 1–like 1 (WHSC1L1, Accession NM_017778), a gene which restores repair of base–base and single– nucleotide insertion–deletion mismatches, and increases the proficiency to process heteroduplexes with insertion–deletion mismatches. Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associ–

ated with WHSC1L1. The function of WHSC1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM475. KIAA1922 (Accession XM_057040) is another VGAM1195 host target gene.

KIAA1922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:36458, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42925] Another function of VGAM1195 is therefore inhibition of KIAA1922 (Accession XM_057040). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1922. Ring Finger Protein 24 (RNF24, Accession NM_007219) is another VGAM1195 host target gene. RNF24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF24, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF24 BINDING SITE, designated SEQ ID:14089, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42926] Another function of VGAM1195 is therefore inhibition of Ring Finger Protein 24 (RNF24, Accession NM_007219). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF24. SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession NM_003003) is another VGAM1195 host target gene. SEC14L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC14L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L1 BINDING SITE, designated SEQ ID:8899, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42927] Another function of VGAM1195 is therefore inhibition of SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession

NM_003003). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L1. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM1195 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE, designated SEQ ID:36770, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42928] Another function of VGAM1195 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. WSB1 (Accession NM_134264) is another VGAM1195 host target gene. WSB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WSB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of WSB1 BINDING SITE, designated SEQ ID:28613, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42929] Another function of VGAM1195 is therefore inhibition of WSB1 (Accession NM_134264). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSB1. LOC150183 (Accession XM_097839) is another VGAM1195 host target gene. LOC150183 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150183 BINDING SITE, designated SEQ ID:41153, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42930] Another function of VGAM1195 is therefore inhibition of LOC150183 (Accession XM_097839). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150183. LOC150184 (Accession XM_097840) is an-

other VGAM1195 host target gene. LOC150184 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150184 BINDING SITE, designated SEQ ID:41154, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42931] Another function of VGAM1195 is therefore inhibition of LOC150184 (Accession XM_097840). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150184. LOC150185 (Accession XM_097834) is another VGAM1195 host target gene. LOC150185 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150185 BINDING SITE, designated SEQ ID:41150, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42932] Another function of VGAM1195 is therefore inhibition of LOC150185 (Accession XM_097834). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150185. LOC255654 (Accession XM_173036) is another VGAM1195 host target gene. LOC255654 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255654 BINDING SITE, designated SEQ ID:46300, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42933] Another function of VGAM1195 is therefore inhibition of LOC255654 (Accession XM_173036). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255654. LOC91069 (Accession XM_035824) is another VGAM1195 host target gene. LOC91069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91069, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91069 BINDING SITE, designated SEQ ID:32343, to the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, also designated SEQ ID:3906.

[42934] Another function of VGAM1195 is therefore inhibition of LOC91069 (Accession XM_035824). Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91069. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1196 (VGAM1196) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42935] VGAM1196 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1196 was detected is described hereinabove with reference to Figs. 1-8.

[42936] VGAM1196 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1196 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[42937] VGAM1196 gene encodes a VGAM1196 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1196 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1196 precursor RNA is designated SEQ ID:1182, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1182 is located at position 82687 relative to the genome of Equine Herpesvirus 1.

[42938] VGAM1196 precursor RNA folds onto itself, forming VGAM1196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42939] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1196 folded precursor RNA into VGAM1196

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1196 RNA is designated SEQ ID:3907, and is provided hereinbelow with reference to the sequence listing part.

[42940] VGAM1196 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1196 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42941] VGAM1196 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1196 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1196 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42942] The complementary binding of VGAM1196 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1196 host target RNA into VGAM1196 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[42943] It is appreciated that VGAM1196 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1196 host target genes. The mRNA of each one of this plurality of VGAM1196 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1196 RNA, herein designated VGAM RNA, and which when bound by VGAM1196 RNA causes inhibition of translation of respective one or more VGAM1196 host target proteins.

[42944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1196 gene, herein designated VGAM GENE, on one or more VGAM1196 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42945] It is yet further appreciated that a function of VGAM1196 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1196 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1196 correlate with, and may be deduced from, the identity of the host target genes which VGAM1196 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42946] Nucleotide sequences of the VGAM1196 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1196 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1196 are further described hereinbelow with reference to Table 1.

[42947] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1196 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1196 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42948] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1196 gene, herein designated VGAM is inhibition of expression of VGAM1196 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1196 correlate with, and may be deduced from, the identity of the target genes which VGAM1196 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42949] Bone Morphogenetic Protein 6 (BMP6, Accession NM_001718) is a VGAM1196 host target gene. BMP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BMP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP6 BINDING SITE, designated SEQ ID:7455, to the nucleotide sequence of VGAM1196 RNA, herein designated

VGAM RNA, also designated SEQ ID:3907.

[42950] A function of VGAM1196 is therefore inhibition of Bone Morphogenetic Protein 6 (BMP6, Accession NM_001718), a gene which induces cartilage and bone formation. Accordingly, utilities of VGAM1196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP6. The function of BMP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM233. Chromosome 20 Open Reading Frame 18 (C20orf18, Accession NM_031228) is another VGAM1196 host target gene. C20orf18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf18 BINDING SITE, designated SEQ ID:25277, to the nucleotide sequence of VGAM1196 RNA, herein designated VGAM RNA, also designated SEQ ID:3907.

[42951] Another function of VGAM1196 is therefore inhibition of Chromosome 20 Open Reading Frame 18 (C20orf18, Ac-

cession NM_031228). Accordingly, utilities of VGAM1196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf18.

FLJ10921 (Accession NM_018272) is another VGAM1196 host target gene. FLJ10921 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10921, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10921 BINDING SITE, designated SEQ ID:20250, to the nucleotide sequence of VGAM1196 RNA, herein designated VGAM RNA, also designated SEQ ID:3907.

[42952] Another function of VGAM1196 is therefore inhibition of FLJ10921 (Accession NM_018272). Accordingly, utilities of VGAM1196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10921. LOC220038 (Accession XM_166257) is another VGAM1196 host target gene. LOC220038 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC220038 BINDING SITE, designated SEQ ID:44082, to the nucleotide sequence of VGAM1196 RNA, herein designated VGAM RNA, also designated SEQ ID:3907.

[42953] Another function of VGAM1196 is therefore inhibition of LOC220038 (Accession XM_166257). Accordingly, utilities of VGAM1196 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1197 (VGAM1197) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42954] VGAM1197 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1197 was detected is described hereinabove with reference to Figs. 1–8.

[42955] VGAM1197 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1197 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[42956] VGAM1197 gene encodes a VGAM1197 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1197 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1197 precursor RNA is designated SEQ ID:1183, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1183 is located at position 80050 relative to the genome of Equine Herpesvirus 1.

[42957] VGAM1197 precursor RNA folds onto itself, forming VGAM1197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42958] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1197 folded precursor RNA into VGAM1197 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1197 RNA is designated SEQ ID:3908, and is provided hereinbelow with reference to the sequence listing part.

[42959] VGAM1197 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1197 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42960] VGAM1197 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1197 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1197 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42961] The complementary binding of VGAM1197 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1197 host target RNA into VGAM1197 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42962] It is appreciated that VGAM1197 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1197 host target genes. The mRNA of each one of this plurality of VGAM1197 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1197 RNA, herein designated VGAM RNA, and which when bound by VGAM1197 RNA causes inhibition of translation of respective one or more VGAM1197 host target proteins.

[42963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1197 gene, herein designated VGAM GENE, on one or more VGAM1197 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42964] It is yet further appreciated that a function of VGAM1197 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1197 correlate with, and may be deduced from, the identity of the host target genes which VGAM1197 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42965] Nucleotide sequences of the VGAM1197 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1197 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1197 are further described hereinbelow with reference to Table 1.

[42966] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1197 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1197 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42967] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1197 gene, herein designated VGAM is inhibition of expression of VGAM1197 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1197 correlate with, and may be deduced from, the identity of the target genes which VGAM1197 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42968] Deleted In Azoospermia-like (DAZL, Accession XM_042839) is a VGAM1197 host target gene. DAZL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAZL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZL BINDING SITE, designated SEQ ID:33799, to the nucleotide sequence of VGAM1197 RNA, herein designated VGAM RNA, also designated SEQ ID:3908.

[42969] A function of VGAM1197 is therefore inhibition of Deleted In Azoospermia-like (DAZL, Accession XM_042839), a gene which may be essential for gametogenesis. Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZL. The function of DAZL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Fanconi Anemia, Complementation Group G (FANCG, Accession NM_004629) is another VGAM1197 host target gene. FANCG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FANCG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCG BINDING SITE, designated SEQ ID:11000, to the nucleotide sequence of VGAM1197 RNA, herein designated VGAM RNA, also designated SEQ ID:3908.

[42970] Another function of VGAM1197 is therefore inhibition of Fanconi Anemia, Complementation Group G (FANCG, Accession NM_004629). Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with FANCG. Regenerating Islet-derived 1 Alpha (pancreatic stone protein, pancreatic thread protein) (REG1A, Accession XM_114278) is another VGAM1197 host target gene. REG1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by REG1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REG1A BINDING SITE, designated SEQ ID:42827, to the nucleotide sequence of VGAM1197 RNA, herein designated VGAM RNA, also designated SEQ ID:3908.

[42971] Another function of VGAM1197 is therefore inhibition of Regenerating Islet-derived 1 Alpha (pancreatic stone protein, pancreatic thread protein) (REG1A, Accession XM_114278), a gene which plays an important role in exocrine pancreatic function, and inhibits CaCO₃ crystal growth. Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REG1A. The function of REG1A has been established by previous studies. Pancreatic stone protein is the major component of the protein matrix of calculi in patients suffering from chronic calcifying pan-

creatitis. Secretory pancreatic stone protein is a glycoprotein in the pancreatic secretion. This protein, called PSPS, occurs in multiple molecular forms due to posttranslational processing. The abundance of PSPS in pancreatic juice (10 to 14% of total protein) suggests that it plays an important role in exocrine pancreatic function. In vitro experiments show that PSPS inhibits CaCO_3 crystal growth. Since in all the pancreatic secretions are supersaturated in calcium carbonate, the physiologic role of PSPS may be related to its inhibitory properties. Demonstration of diminished PSPS in the pancreatic juice of patients with chronic calcifying pancreatitis supported that hypothesis. Giorgi et al. (1989) isolated a cDNA encoding pre-PSPS from a human pancreatic cDNA library. They found that PSPS mRNA was 3 times lower in chronic calcifying pancreatitis than in controls; the message for trypsinogen, chymotrypsinogen, and colipase were not altered. Giorgi et al. (1989) concluded that PSPS gene expression is specifically reduced in CCP patients. Is a defect in this gene the basis for some cases of hereditary pancreatitis (OMIM Ref. No. 167800)? Terazono et al. (1988) cloned and sequenced a cDNA derived from pancreatic islets following partial pancreatectomy. On the basis of its induction during regrowth of the

pancreas and its apparent origin from islets, the corresponding gene was termed REG (for regeneration) with the implication that the gene was involved in islet regeneration. Stewart (1989) found that the sequence was identical to that of pancreatic stone protein. Verdier et al. (1992), who referred to pancreatic stone protein as lithostathine (Sarles et al., 1990), presented evidence that the kidney produces a protein immunologically similar to lithostathine. They suggested that it is responsible for preventing the formation of renal stones since the urine in the thin descending limb of the Henle loop is supersaturated in CaCO_3 as is pancreatic juice. Akiyama et al. (2001) studied the mechanism by which the REG gene is activated in beta cells. They found that the combined addition of interleukin-6 (OMIM Ref. No. 147620) and dexamethasone induced the expression of the REG gene in beta cells and that inhibitors of poly(ADP-ribose) polymerase (PARP; 173870) enhanced the expression. PARP inhibitors enhanced the DNA-protein complex formation for REG gene transcription and stabilized the complex by inhibiting the autopoly(ADP-ribosylation) of PARP.

[42972] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [42973] Sarles, H.; Dagorn, J. C.; Giorgi, D.; Bernard, J. P. : Renaming pancreatic stone protein as 'lithostathine'. (Letter) Gastroenterology 99: 900–901, 1990. ; and

- [42975] Further studies establishing the function and utilities of REG1A are found in John Hopkins OMIM database record ID 167770, and in cited publications numbered 10918–1091 and 10919–10924 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sex Comb On Midleg-like 1 (Drosophila) (SCML1, Accession NM_006746) is another VGAM1197 host target gene. SCML1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCML1 BINDING SITE, designated SEQ ID:13592, to the nucleotide sequence of VGAM1197 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3908.

[42976] Another function of VGAM1197 is therefore inhibition of Sex Comb On Midleg-like 1 (Drosophila) (SCML1, Accession NM_006746). Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML1. BANK (Accession NM_017935) is another VGAM1197 host target gene. BANK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BANK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BANK BINDING SITE, designated SEQ ID:19625, to the nucleotide sequence of VGAM1197 RNA, herein designated VGAM RNA, also designated SEQ ID:3908.

[42977] Another function of VGAM1197 is therefore inhibition of BANK (Accession NM_017935). Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANK. KIAA0553 (Accession XM_045981) is another VGAM1197 host target gene. KIAA0553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0553, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0553 BINDING SITE, designated SEQ ID:34632, to the nucleotide sequence of VGAM1197 RNA, herein designated VGAM RNA, also designated SEQ ID:3908.

[42978] Another function of VGAM1197 is therefore inhibition of KIAA0553 (Accession XM_045981). Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0553. PRO0097 (Accession NM_014114) is another VGAM1197 host target gene. PRO0097 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0097 BINDING SITE, designated SEQ ID:15363, to the nucleotide sequence of VGAM1197 RNA, herein designated VGAM RNA, also designated SEQ ID:3908.

[42979] Another function of VGAM1197 is therefore inhibition of PRO0097 (Accession NM_014114). Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRO0097. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1198 (VGAM1198) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42980] VGAM1198 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1198 was detected is described hereinabove with reference to Figs. 1–8.

[42981] VGAM1198 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1198 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42982] VGAM1198 gene encodes a VGAM1198 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1198 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1198 precursor RNA is desig-

nated SEQ ID:1184, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1184 is located at position 80155 relative to the genome of Equine Herpesvirus 1.

- [42983] VGAM1198 precursor RNA folds onto itself, forming VGAM1198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [42984] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1198 folded precursor RNA into VGAM1198 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1198 RNA is designated SEQ ID:3909, and is provided hereinbelow with reference to the sequence

listing part.

[42985] VGAM1198 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1198 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[42986] VGAM1198 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1198 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1198 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[42987] The complementary binding of VGAM1198 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1198 host target RNA into VGAM1198 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42988] It is appreciated that VGAM1198 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1198 host target genes. The mRNA of each one of this plurality of VGAM1198 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1198 RNA, herein designated VGAM

RNA, and which when bound by VGAM1198 RNA causes inhibition of translation of respective one or more VGAM1198 host target proteins.

[42989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1198 gene, herein designated VGAM GENE, on one or more VGAM1198 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[42990] It is yet further appreciated that a function of VGAM1198 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1198 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1198 correlate with, and may be deduced from, the identity of the host target genes which VGAM1198 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42991] Nucleotide sequences of the VGAM1198 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1198 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1198 are further described hereinbelow with reference to Table 1.

[42992] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1198 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1198 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42993] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1198 gene, herein designated VGAM is

inhibition of expression of VGAM1198 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1198 correlate with, and may be deduced from, the identity of the target genes which VGAM1198 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[42994] Polymerase (DNA directed), Eta (POLH, Accession NM_006502) is a VGAM1198 host target gene. POLH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by POLH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLH BINDING SITE, designated SEQ ID:13248, to the nucleotide sequence of VGAM1198 RNA, herein designated VGAM RNA, also designated SEQ ID:3909.

[42995] A function of VGAM1198 is therefore inhibition of Polymerase (DNA directed), Eta (POLH, Accession NM_006502). Accordingly, utilities of VGAM1198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLH. N-myristoyltransferase 1 (NMT1, Accession NM_021079) is another VGAM1198 host target gene. NMT1 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NMT1 BINDING SITE, designated SEQ ID:22047, to the nucleotide sequence of VGAM1198 RNA, herein designated VGAM RNA, also designated SEQ ID:3909.

[42996] Another function of VGAM1198 is therefore inhibition of N-myristoyltransferase 1 (NMT1, Accession NM_021079). Accordingly, utilities of VGAM1198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NMT1. LOC150208 (Accession XM_097841) is another VGAM1198 host target gene. LOC150208 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150208, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150208 BINDING SITE, designated SEQ ID:41157, to the nucleotide sequence of VGAM1198 RNA, herein designated VGAM RNA, also designated SEQ ID:3909.

[42997] Another function of VGAM1198 is therefore inhibition of LOC150208 (Accession XM_097841). Accordingly, utilities of VGAM1198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150208. LOC255631 (Accession XM_171267) is another VGAM1198 host target gene. LOC255631 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255631 BINDING SITE, designated SEQ ID:46039, to the nucleotide sequence of VGAM1198 RNA, herein designated VGAM RNA, also designated SEQ ID:3909.

[42998] Another function of VGAM1198 is therefore inhibition of LOC255631 (Accession XM_171267). Accordingly, utilities of VGAM1198 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255631. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1199 (VGAM1199) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[42999] VGAM1199 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1199 was detected is described hereinabove with reference to Figs. 1-8.

[43000] VGAM1199 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Nephritis Virus. VGAM1199 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43001] VGAM1199 gene encodes a VGAM1199 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1199 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1199 precursor RNA is designated SEQ ID:1185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1185 is located at position 6153 relative to the genome of Avian Nephritis Virus.

[43002] VGAM1199 precursor RNA folds onto itself, forming VGAM1199 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43003] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1199 folded precursor RNA into VGAM1199 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1199 RNA is designated SEQ ID:3910, and is provided hereinbelow with reference to the sequence listing part.

[43004] VGAM1199 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1199 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43005] VGAM1199 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1199 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1199 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43006] The complementary binding of VGAM1199 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1199 host target RNA into VGAM1199 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43007] It is appreciated that VGAM1199 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1199 host target genes. The mRNA of each one of this plurality of VGAM1199 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1199 RNA, herein designated VGAM RNA, and which when bound by VGAM1199 RNA causes inhibition of translation of respective one or more VGAM1199 host target proteins.

[43008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1199 gene, herein designated VGAM GENE, on one or more VGAM1199 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43009] It is yet further appreciated that a function of VGAM1199 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1199 include diagnosis, prevention and treatment of viral infection by Avian Nephritis Virus. Specific functions, and accordingly utilities, of VGAM1199 correlate with, and may be deduced from, the identity of the host target genes which VGAM1199 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[43010] Nucleotide sequences of the VGAM1199 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1199 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1199 are further described hereinbelow with reference to Table 1.

[43011] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1199 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1199 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43012] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1199 gene, herein designated VGAM is inhibition of expression of VGAM1199 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1199 correlate with, and may be deduced from, the identity of the target genes which VGAM1199 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43013] CD164 Antigen, Sialomucin (CD164, Accession NM_006016) is a VGAM1199 host target gene. CD164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD164 BINDING SITE, designated SEQ ID:12628, to the nucleotide sequence of VGAM1199 RNA, herein designated VGAM RNA, also designated SEQ ID:3910.

[43014] A function of VGAM1199 is therefore inhibition of CD164 Antigen, Sialomucin (CD164, Accession NM_006016), a gene which plays a role in hematopoiesis by facilitating the adhesion of CD34+ cells to bone marrow stroma and negatively regulates CD34+ hematopoietic progenitor cell growth. Accordingly, utilities of VGAM1199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD164. The function of CD164 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM75.LOC157226 (Accession XM_033876) is another VGAM1199 host target gene. LOC157226 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157226 BINDING SITE, designated SEQ ID:31974, to the nucleotide sequence of VGAM1199 RNA, herein designated VGAM RNA, also designated SEQ ID:3910.

[43015] Another function of VGAM1199 is therefore inhibition of LOC157226 (Accession XM_033876). Accordingly, utilities of VGAM1199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157226. LOC91974 (Accession XM_041974) is another VGAM1199 host target gene. LOC91974 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91974, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91974 BINDING SITE, designated SEQ ID:33650, to the nucleotide sequence of VGAM1199 RNA, herein designated VGAM RNA, also designated SEQ ID:3910.

[43016] Another function of VGAM1199 is therefore inhibition of

LOC91974 (Accession XM_041974). Accordingly, utilities of VGAM1199 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91974. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1200 (VGAM1200) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43017] VGAM1200 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1200 was detected is described hereinabove with reference to Figs. 1-8.

[43018] VGAM1200 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Nephritis Virus. VGAM1200 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43019] VGAM1200 gene encodes a VGAM1200 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1200 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1200 precursor RNA is designated SEQ ID:1186, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1186 is located at position 5356 relative to the genome of Avian Nephritis Virus.

[43020] VGAM1200 precursor RNA folds onto itself, forming VGAM1200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43021] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1200 folded precursor RNA into VGAM1200 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide se-

quence of VGAM1200 RNA is designated SEQ ID:3911, and is provided hereinbelow with reference to the sequence listing part.

[43022] VGAM1200 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1200 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43023] VGAM1200 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1200 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1200 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[43024] The complementary binding of VGAM1200 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1200 host target RNA into VGAM1200 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43025] It is appreciated that VGAM1200 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1200 host target genes. The mRNA of each one of this plurality of VGAM1200 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1200 RNA, herein designated VGAM RNA, and which when bound by VGAM1200 RNA causes inhibition of translation of respective one or more VGAM1200 host target proteins.

[43026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1200 gene, herein designated VGAM GENE, on one or more VGAM1200 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43027] It is yet further appreciated that a function of VGAM1200

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of viral infection by Avian Nephritis Virus. Specific functions, and accordingly utilities, of VGAM1200 correlate with, and may be deduced from, the identity of the host target genes which VGAM1200 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43028] Nucleotide sequences of the VGAM1200 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1200 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1200 are further described hereinbelow with reference to Table 1.

[43029] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1200 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1200 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43030] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1200 gene, herein designated VGAM is inhibition of expression of VGAM1200 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1200 correlate with, and may be deduced from, the identity of the target genes which VGAM1200 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43031] Adenylate Cyclase 6 (ADCY6, Accession NM_015270) is a VGAM1200 host target gene. ADCY6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADCY6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE, designated SEQ ID:17590, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43032] A function of VGAM1200 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM_015270), a gene which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ADCY6. The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM22. Aldehyde Dehydrogenase 1 Family, Member B1 (ALDH1B1, Accession NM_000692) is another VGAM1200 host target gene. ALDH1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH1B1 BINDING SITE, designated SEQ ID:6349, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43033] Another function of VGAM1200 is therefore inhibition of Aldehyde Dehydrogenase 1 Family, Member B1 (ALDH1B1, Accession NM_000692). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1B1. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM1200 host target gene. DAAM2 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44327, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43034] Another function of VGAM1200 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is another VGAM1200 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7742, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43035] Another function of VGAM1200 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Growth Arrest-specific 7 (GAS7, Accession NM_003644) is another VGAM1200 host target gene. GAS7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAS7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAS7 BINDING SITE, designated SEQ ID:9713, to the nucleotide sequence of VGAM1200 RNA, herein

designated VGAM RNA, also designated SEQ ID:3911.

[43036] Another function of VGAM1200 is therefore inhibition of Growth Arrest-specific 7 (GAS7, Accession NM_003644), a gene which may play a role in promoting maturation and morphological differentiation of cerebellar neurons. Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS7. The function of GAS7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Keratocan (KERA, Accession NM_007035) is another VGAM1200 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:13909, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43037] Another function of VGAM1200 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal

transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM723. Matrix Metalloproteinase 25 (MMP25, Accession NM_022468) is another VGAM1200 host target gene. MMP25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MMP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP25 BINDING SITE, designated SEQ ID:22820, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43038] Another function of VGAM1200 is therefore inhibition of Matrix Metalloproteinase 25 (MMP25, Accession NM_022468). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP25. Periplakin (PPL, Accession NM_002705) is another VGAM1200 host target

gene. PPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPL BINDING SITE, designated SEQ ID:8553, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43039] Another function of VGAM1200 is therefore inhibition of Periplakin (PPL, Accession NM_002705). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPL. Transcription Factor 19 (SC1) (TCF19, Accession XM_175251) is another VGAM1200 host target gene.

TCF19 BINDING SITE1 and TCF19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCF19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF19 BINDING SITE1 and TCF19 BINDING SITE2, designated SEQ ID:46711 and SEQ ID:46662 respectively, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3911.

[43040] Another function of VGAM1200 is therefore inhibition of Transcription Factor 19 (SC1) (TCF19, Accession XM_175251), a gene which plays an important role in the transcription of genes required for the later stages of cell cycle progression. Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF19. The function of TCF19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM299. Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312) is another VGAM1200 host target gene. C11orf23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf23 BINDING SITE, designated SEQ ID:20299, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43041] Another function of VGAM1200 is therefore inhibition of

Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf23. DC-TM4F2 (Accession NM_030927) is another VGAM1200 host target gene. DC-TM4F2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DC-TM4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DC-TM4F2 BINDING SITE, designated SEQ ID:25198, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43042] Another function of VGAM1200 is therefore inhibition of DC-TM4F2 (Accession NM_030927). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DC-TM4F2. Di-Ras2 (Accession NM_017594) is another VGAM1200 host target gene. Di-Ras2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Di-Ras2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Di-Ras2 BINDING SITE, designated SEQ ID:19044, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43043] Another function of VGAM1200 is therefore inhibition of Di-Ras2 (Accession NM_017594). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Di-Ras2. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM1200 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:21145, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43044] Another function of VGAM1200 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of

VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ12542 (Accession NM_024899) is another VGAM1200 host target gene. FLJ12542 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12542, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12542 BINDING SITE, designated SEQ ID:24382, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43045] Another function of VGAM1200 is therefore inhibition of FLJ12542 (Accession NM_024899). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12542. FLJ12800 (Accession NM_022903) is another VGAM1200 host target gene. FLJ12800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12800

BINDING SITE, designated SEQ ID:23193, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43046] Another function of VGAM1200 is therefore inhibition of FLJ12800 (Accession NM_022903). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800. FLJ13693 (Accession NM_024807) is another VGAM1200 host target gene. FLJ13693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13693 BINDING SITE, designated SEQ ID:24186, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43047] Another function of VGAM1200 is therefore inhibition of FLJ13693 (Accession NM_024807). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13693. FLJ20730 (Accession NM_017945) is another VGAM1200 host target gene. FLJ20730 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20730 BINDING SITE, designated SEQ ID:19641, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43048] Another function of VGAM1200 is therefore inhibition of FLJ20730 (Accession NM_017945). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20730. FLJ22127 (Accession NM_022775) is another VGAM1200 host target gene. FLJ22127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22127 BINDING SITE, designated SEQ ID:23040, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43049] Another function of VGAM1200 is therefore inhibition of

FLJ22127 (Accession NM_022775). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22127. FLJ23191 (Accession NM_024574) is another VGAM1200 host target gene. FLJ23191 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23191 BINDING SITE, designated SEQ ID:23801, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43050] Another function of VGAM1200 is therefore inhibition of FLJ23191 (Accession NM_024574). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23191. GMPPB (Accession XM_171044) is another VGAM1200 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45818, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43051] Another function of VGAM1200 is therefore inhibition of GMPPB (Accession XM_171044). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. KIAA1854 (Accession XM_049884) is another VGAM1200 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35536, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43052] Another function of VGAM1200 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. KIAA1912 (Accession XM_055636) is another

VGAM1200 host target gene. KIAA1912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1912 BINDING SITE, designated SEQ ID:36311, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43053] Another function of VGAM1200 is therefore inhibition of KIAA1912 (Accession XM_055636). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1912. Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117) is another VGAM1200 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ ID:21198, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ

ID:3911.

[43054] Another function of VGAM1200 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL4. MR (Accession NM_031212) is another VGAM1200 host target gene. MR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MR BINDING SITE, designated SEQ ID:25254, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43055] Another function of VGAM1200 is therefore inhibition of MR (Accession NM_031212). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MR. LOC129831 (Accession XM_059376) is another VGAM1200 host target gene. LOC129831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129831, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129831 BINDING SITE, designated SEQ ID:36980, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43056] Another function of VGAM1200 is therefore inhibition of LOC129831 (Accession XM_059376). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129831. LOC130644 (Accession XM_065813) is another VGAM1200 host target gene. LOC130644 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC130644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130644 BINDING SITE, designated SEQ ID:37301, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43057] Another function of VGAM1200 is therefore inhibition of LOC130644 (Accession XM_065813). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC130644. LOC151121 (Accession XM_087102) is another VGAM1200 host target gene. LOC151121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151121 BINDING SITE, designated SEQ ID:39051, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43058] Another function of VGAM1200 is therefore inhibition of LOC151121 (Accession XM_087102). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151121. LOC151778 (Accession XM_049352) is another VGAM1200 host target gene. LOC151778 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151778, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151778 BINDING SITE, designated SEQ ID:35397, to

the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43059] Another function of VGAM1200 is therefore inhibition of LOC151778 (Accession XM_049352). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151778. LOC153396 (Accession XM_087662) is another VGAM1200 host target gene. LOC153396 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153396 BINDING SITE, designated SEQ ID:39371, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43060] Another function of VGAM1200 is therefore inhibition of LOC153396 (Accession XM_087662). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153396. LOC155340 (Accession XM_055725) is another VGAM1200 host target gene. LOC155340 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC155340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155340 BINDING SITE, designated SEQ ID:36316, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43061] Another function of VGAM1200 is therefore inhibition of LOC155340 (Accession XM_055725). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155340. LOC157867 (Accession XM_098831) is another VGAM1200 host target gene. LOC157867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157867 BINDING SITE, designated SEQ ID:41856, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43062] Another function of VGAM1200 is therefore inhibition of LOC157867 (Accession XM_098831). Accordingly, utilities

of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157867. LOC158345 (Accession XM_034640) is another VGAM1200 host target gene. LOC158345 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158345, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158345 BINDING SITE, designated SEQ ID:32132, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43063] Another function of VGAM1200 is therefore inhibition of LOC158345 (Accession XM_034640). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158345. LOC159193 (Accession XM_089436) is another VGAM1200 host target gene. LOC159193 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC159193 BINDING SITE, designated SEQ ID:39976, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43064] Another function of VGAM1200 is therefore inhibition of LOC159193 (Accession XM_089436). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159193. LOC255620 (Accession XM_173132) is another VGAM1200 host target gene. LOC255620 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255620 BINDING SITE, designated SEQ ID:46378, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43065] Another function of VGAM1200 is therefore inhibition of LOC255620 (Accession XM_173132). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255620. LOC256598 (Accession XM_172816) is another VGAM1200 host target gene. LOC256598 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256598 BINDING SITE, designated SEQ ID:46097, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43066] Another function of VGAM1200 is therefore inhibition of LOC256598 (Accession XM_172816). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256598. LOC91759 (Accession XM_040467) is another VGAM1200 host target gene. LOC91759 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91759 BINDING SITE, designated SEQ ID:33301, to the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, also designated SEQ ID:3911.

[43067] Another function of VGAM1200 is therefore inhibition of

LOC91759 (Accession XM_040467). Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91759. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1201 (VGAM1201) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43068] VGAM1201 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1201 was detected is described hereinabove with reference to Figs. 1-8.

[43069] VGAM1201 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Nephritis Virus. VGAM1201 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43070] VGAM1201 gene encodes a VGAM1201 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1201 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1201 precursor RNA is designated SEQ ID:1187, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1187 is located at position 5950 relative to the genome of Avian Nephritis Virus.

- [43071] VGAM1201 precursor RNA folds onto itself, forming VGAM1201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43072] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1201 folded precursor RNA into VGAM1201 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM1201 RNA is designated SEQ ID:3912, and is provided hereinbelow with reference to the sequence listing part.

[43073] VGAM1201 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1201 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43074] VGAM1201 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1201 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1201 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[43075] The complementary binding of VGAM1201 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1201 host target RNA into VGAM1201 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43076] It is appreciated that VGAM1201 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1201 host target genes. The mRNA of each one of this plurality of VGAM1201 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1201 RNA, herein designated VGAM RNA, and which when bound by VGAM1201 RNA causes inhibition of translation of respective one or more VGAM1201 host target proteins.

[43077] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1201 gene, herein designated VGAM GENE, on one or more VGAM1201 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43078] It is yet further appreciated that a function of VGAM1201

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of viral infection by Avian Nephritis Virus. Specific functions, and accordingly utilities, of VGAM1201 correlate with, and may be deduced from, the identity of the host target genes which VGAM1201 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43079] Nucleotide sequences of the VGAM1201 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1201 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1201 are further described hereinbelow with reference to Table 1.

[43080] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1201 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1201 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43081] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1201 gene, herein designated VGAM is inhibition of expression of VGAM1201 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1201 correlate with, and may be deduced from, the identity of the target genes which VGAM1201 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43082] Exostoses (multiple)-like 2 (EXTL2, Accession NM_001439) is a VGAM1201 host target gene. EXTL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EXTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL2 BINDING SITE, designated SEQ ID:7164, to the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43083] A function of VGAM1201 is therefore inhibition of Exostoses (multiple)-like 2 (EXTL2, Accession NM_001439), a gene which is homologous to the EXT and EXTL genes. Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with EXTL2. The function of EXTL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM743.KIAA1580 (Accession XM_045271) is another VGAM1201 host target gene. KIAA1580 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1580 BINDING SITE, designated SEQ ID:34409, to the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43084] Another function of VGAM1201 is therefore inhibition of KIAA1580 (Accession XM_045271). Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1580. KIAA1879 (Accession XM_056635) is another VGAM1201 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36410, to the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43085] Another function of VGAM1201 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM_004263) is another VGAM1201 host target gene. SEMA4F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA4F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4F BINDING SITE, designated SEQ ID:10455, to the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43086] Another function of VGAM1201 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmem-

brane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM_004263). Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4F. LOC127534 (Accession XM_060532) is another VGAM1201 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37163, to the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43087] Another function of VGAM1201 is therefore inhibition of LOC127534 (Accession XM_060532). Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC151178 (Accession XM_087117) is another VGAM1201 host target gene. LOC151178 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151178, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151178 BINDING SITE, designated SEQ ID:39067, to the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43088] Another function of VGAM1201 is therefore inhibition of LOC151178 (Accession XM_087117). Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151178. LOC158987 (Accession XM_099015) is another VGAM1201 host target gene. LOC158987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158987 BINDING SITE, designated SEQ ID:42045, to the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43089] Another function of VGAM1201 is therefore inhibition of LOC158987 (Accession XM_099015). Accordingly, utilities of VGAM1201 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158987. LOC221833 (Accession XM_166519) is another VGAM1201 host target gene. LOC221833 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221833 BINDING SITE, designated SEQ ID:44454, to the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43090] Another function of VGAM1201 is therefore inhibition of LOC221833 (Accession XM_166519). Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221833. LOC91661 (Accession NM_138372) is another VGAM1201 host target gene. LOC91661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE, designated SEQ ID:28750, to the

nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, also designated SEQ ID:3912.

[43091] Another function of VGAM1201 is therefore inhibition of LOC91661 (Accession NM_138372). Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1202 (VGAM1202) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43092] VGAM1202 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1202 was detected is described hereinabove with reference to Figs. 1–8.

[43093] VGAM1202 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Nephritis Virus. VGAM1202 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43094] VGAM1202 gene encodes a VGAM1202 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1202 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1202 precursor RNA is designated SEQ ID:1188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1188 is located at position 3947 relative to the genome of Avian Nephritis Virus.

- [43095] VGAM1202 precursor RNA folds onto itself, forming VGAM1202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43096] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1202 folded precursor RNA into VGAM1202 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1202 RNA is designated SEQ ID:3913, and is provided hereinbelow with reference to the sequence listing part.

[43097] VGAM1202 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1202 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43098] VGAM1202 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1202 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1202 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43099] The complementary binding of VGAM1202 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1202 host target RNA into VGAM1202 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43100] It is appreciated that VGAM1202 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1202 host target genes. The mRNA of each one of this plurality of VGAM1202 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1202 RNA, herein designated VGAM RNA, and which when bound by VGAM1202 RNA causes inhibition of translation of respective one or more VGAM1202 host target proteins.

[43101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1202 gene, herein designated VGAM GENE, on one or more VGAM1202 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[43102] It is yet further appreciated that a function of VGAM1202 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1202 include diagnosis, prevention and treatment of viral infection by Avian Nephritis Virus. Specific functions, and accordingly utilities, of VGAM1202 correlate with, and may be deduced from, the identity of the host target genes which VGAM1202 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43103] Nucleotide sequences of the VGAM1202 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1202 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1202 are further described hereinbelow with reference to Table 1.

[43104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1202 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1202 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43105] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1202 gene, herein designated VGAM is inhibition of expression of VGAM1202 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1202 correlate with, and may be deduced from, the identity of the target genes which VGAM1202 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43106] Phosphoribosyl Pyrophosphate Synthetase 1 (PRPS1, Accession NM_002764) is a VGAM1202 host target gene. PRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPS1 BINDING SITE, designated SEQ ID:8653, to the nucleotide sequence of VGAM1202 RNA, herein designated VGAM RNA, also designated SEQ ID:3913.

[43107] A function of VGAM1202 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase 1 (PRPS1, Accession

NM_002764). Accordingly, utilities of VGAM1202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPS1. KIAA0237 (Accession NM_014747) is another VGAM1202 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16450, to the nucleotide sequence of VGAM1202 RNA, herein designated VGAM RNA, also designated SEQ ID:3913.

[43108] Another function of VGAM1202 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM1202 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1203 (VGAM1203) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[43109] VGAM1203 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1203 was detected is described hereinabove with reference to Figs. 1–8.

[43110] VGAM1203 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Scallion Virus X. VGAM1203 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43111] VGAM1203 gene encodes a VGAM1203 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1203 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1203 precursor RNA is designated SEQ ID:1189, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1189 is located at position 2316 relative to the genome of Scallion Virus X.

[43112] VGAM1203 precursor RNA folds onto itself, forming VGAM1203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43113] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1203 folded precursor RNA into VGAM1203 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1203 RNA is designated SEQ ID:3914, and is provided hereinbelow with reference to the sequence listing part.

[43114] VGAM1203 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1203 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[43115] VGAM1203 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1203 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1203 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[43116] The complementary binding of VGAM1203 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1203 host target RNA into VGAM1203 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43117] It is appreciated that VGAM1203 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1203 host target genes. The mRNA of each one of this plurality of VGAM1203 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1203 RNA, herein designated VGAM RNA, and which when bound by VGAM1203 RNA causes inhibition of translation of respective one or more VGAM1203 host target proteins.

[43118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1203 gene, herein designated VGAM GENE, on one

or more VGAM1203 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43119] It is yet further appreciated that a function of VGAM1203 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1203 include diagnosis, prevention and treatment of viral infection by Scallion Virus X. Specific functions, and accordingly utilities, of VGAM1203 correlate with, and may be deduced from, the identity of the host target genes which VGAM1203 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43120] Nucleotide sequences of the VGAM1203 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1203 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1203 are further described hereinbelow with reference to Table 1.

[43121] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1203 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1203 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43122] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1203 gene, herein designated VGAM is inhibition of expression of VGAM1203 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1203 correlate with, and may be deduced from, the identity of the target genes which VGAM1203 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43123] LOC149296 (Accession XM_086481) is a VGAM1203 host

target gene. LOC149296 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149296 BINDING SITE, designated SEQ ID:38694, to the nucleotide sequence of VGAM1203 RNA, herein designated VGAM RNA, also designated SEQ ID:3914.

[43124] A function of VGAM1203 is therefore inhibition of LOC149296 (Accession XM_086481). Accordingly, utilities of VGAM1203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149296. LOC149721 (Accession XM_086649) is another VGAM1203 host target gene. LOC149721 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149721 BINDING SITE, designated SEQ ID:38810, to the nucleotide sequence of VGAM1203 RNA, herein designated VGAM RNA, also designated SEQ ID:3914.

[43125] Another function of VGAM1203 is therefore inhibition of LOC149721 (Accession XM_086649). Accordingly, utilities of VGAM1203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149721. LOC153338 (Accession XM_098361) is another VGAM1203 host target gene. LOC153338 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153338 BINDING SITE, designated SEQ ID:41611, to the nucleotide sequence of VGAM1203 RNA, herein designated VGAM RNA, also designated SEQ ID:3914.

[43126] Another function of VGAM1203 is therefore inhibition of LOC153338 (Accession XM_098361). Accordingly, utilities of VGAM1203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153338. LOC254413 (Accession XM_173141) is another VGAM1203 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46400, to the nucleotide sequence of VGAM1203 RNA, herein designated VGAM RNA, also designated SEQ ID:3914.

[43127] Another function of VGAM1203 is therefore inhibition of LOC254413 (Accession XM_173141). Accordingly, utilities of VGAM1203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. LOC254755 (Accession XM_173224) is another VGAM1203 host target gene. LOC254755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254755 BINDING SITE, designated SEQ ID:46487, to the nucleotide sequence of VGAM1203 RNA, herein designated VGAM RNA, also designated SEQ ID:3914.

[43128] Another function of VGAM1203 is therefore inhibition of LOC254755 (Accession XM_173224). Accordingly, utilities of VGAM1203 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254755. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1204 (VGAM1204) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43129] VGAM1204 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1204 was detected is described hereinabove with reference to Figs. 1–8.

[43130] VGAM1204 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Scallion Virus X. VGAM1204 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43131] VGAM1204 gene encodes a VGAM1204 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1204 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1204 precursor RNA is designated SEQ ID:1190, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1190 is located at position 3095 relative to the genome of Scallion Virus X.

- [43132] VGAM1204 precursor RNA folds onto itself, forming VGAM1204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43133] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1204 folded precursor RNA into VGAM1204 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1204 RNA is designated SEQ ID:3915, and is provided hereinbelow with reference to the sequence listing part.

[43134] VGAM1204 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1204 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43135] VGAM1204 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1204 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1204 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43136] The complementary binding of VGAM1204 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1204 host target RNA into VGAM1204 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43137] It is appreciated that VGAM1204 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1204 host target genes. The mRNA of each one of this plurality of VGAM1204 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1204 RNA, herein designated VGAM RNA, and which when bound by VGAM1204 RNA causes

inhibition of translation of respective one or more VGAM1204 host target proteins.

[43138] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1204 gene, herein designated VGAM GENE, on one or more VGAM1204 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. [43139] It is yet further appreciated that a function of VGAM1204 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1204 include diagnosis, prevention and

treatment of viral infection by Scallion Virus X. Specific functions, and accordingly utilities, of VGAM1204 correlate with, and may be deduced from, the identity of the host target genes which VGAM1204 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43140] Nucleotide sequences of the VGAM1204 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1204 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1204 are further described hereinbelow with reference to Table 1.

[43141] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1204 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1204 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43142] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1204 gene, herein designated VGAM is inhibition of expression of VGAM1204 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1204 correlate with, and may be deduced from, the identity of the target genes which VGAM1204 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43143] Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782) is a VGAM1204 host target gene. CYP24 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CYP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP24 BINDING SITE, designated SEQ ID:6424, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43144] A function of VGAM1204 is therefore inhibition of Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782), a gene which induces the differentiation of promyelocytes into monocytes/macrophages. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP24.

The function of CYP24 has been established by previous studies. 1,25-Dihydroxyvitamin D₃, the physiologically active form of vitamin D₃, exerts its functions through a receptor-mediated mechanism (OMIM Ref. No. 277440). In addition to its fundamental role in calcium metabolism, 1,25-(OH)₂D₃ acts on a variety of tissues. One of its most important functions is its differentiating activity. The best-characterized incidence of this activity is induction of differentiation of promyelocytes into monocytes/macrophages. 1,25-(OH)₂D₃ is biologically inactivated through a series of reactions beginning with 24-hydroxylation. 1,25-(OH)₂D₃ induces the 24-hydroxylase, whereas hypocalcemia, through increased parathyroid hormone, suppresses this enzyme. Chen et al. (1993) isolated the cDNA encoding the human 24-hydroxylase, sequenced it, and demonstrated that it is active when expressed in genetic expression systems. Using array comparative genomic hybridization (CGH), Albertson et al. (2000) resolved 2 regions of amplification within an approximately 2-Mb region of recurrent aberration at 20q13.2 in breast cancer (OMIM Ref. No. 114480). The putative oncogene ZNF217 (OMIM Ref. No. 602967) mapped to one peak, and CYP24, whose overexpression is

likely to lead to abrogation of growth control mediated by vitamin D, mapped to the other. Fine mapping demonstrated that ZNF217 lies proximal to CYP24. As transcription of CYP24 is closely coupled to the level and activity of the vitamin D receptor (VDR; 601769), Albertson et al. (2000) measured both CYP24 and VDR transcript levels using quantitative PCR in breast tumors. Expression of CYP24, normalized with respect to VDR, correlated with copy number of CYP24 in the tumors, further supporting an oncogenic role for CYP24.

[43145] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43146] Chen, K.-S.; Prahl, J. M.; DeLuca, H. F. : Isolation and expression of human 1,25-dihydroxyvitamin D3 24-hydroxylase cDNA. Proc. Nat. Acad. Sci. 90: 4543-4547, 1993. ; and

[43147] Albertson, D. G.; Ylstra, B.; Segraves, R.; Collins, C.; Dairkee, S. H.; Kowbel, D.; Kuo, W.- L.; Gray, J. W.; Pinkel, D. : Quantitative mapping of amplicon structure by array CGH identi.

[43148] Further studies establishing the function and utilities of CYP24 are found in John Hopkins OMIM database record

ID 126065, and in cited publications numbered 4359–4364 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is another VGAM1204 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14504, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43149] Another function of VGAM1204 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described here–

inabove with reference to VGAM118. Enhancer of Zeste Homolog 1 (Drosophila) (EZH1, Accession NM_001991) is another VGAM1204 host target gene. EZH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EZH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EZH1 BINDING SITE, designated SEQ ID:7717, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43150] Another function of VGAM1204 is therefore inhibition of Enhancer of Zeste Homolog 1 (Drosophila) (EZH1, Accession NM_001991), a gene which may act in transcriptional regulation and heterochromatin maintenance. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZH1. The function of EZH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM251. Glutaredoxin (thioltransferase) (GLRX, Accession NM_002064) is another VGAM1204 host target gene. GLRX BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLRX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLRX BINDING SITE, designated SEQ ID:7831, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43151] Another function of VGAM1204 is therefore inhibition of Glutaredoxin (thioltransferase) (GLRX, Accession NM_002064), a gene which has a glutathione-disulfide oxidoreductase activity and reduces low molecular weight disulfides and proteins. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLRX. The function of GLRX has been established by previous studies. Glutaredoxin is a glutathione (GSH)-dependent hydrogen donor for ribonucleotide reductase and also catalyzes glutathione-disulfide oxidoreduction reactions in the presence of NADPH and glutathione reductase. Padilla et al. (1995) purified a human placental glutaredoxin to homogeneity and showed that its amino acid sequence was similar to that of other known mammalian

glutaredoxins (about 80% identity), with some important differences. A cDNA that encodes the entire GRX open reading frame (ORF) and flanking sequences was isolated from a human spleen cDNA library. Glutaredoxin is a small protein of 12 kD. Raghavachari et al. (2001) investigated how the expression of thioltransferase (TTase), a critical thiol repair and dethiolating enzyme, is regulated in human lens epithelial cells under oxidative stress. They also examined whether depleting the primary cellular antioxidant glutathione in these cells has any influence on TTase expression under the same conditions. They found a transient increase in TTase mRNA after 5 minutes of H_2O_2 treatment. Upregulation reached a maximum of 80% above normal by 10 minutes and gradually decreased as the cells detoxified the oxidant. They found that manipulation of cellular GSH resulted in minimal changes in TTase expression. When cells depleted of GSH were subjected to oxidative stress, TTase expression was also strongly upregulated. Raghavachari et al. (2001) concluded that the upregulation of TTase expression in lens epithelial cells could be an adaptive response of the cells to combat oxidative stress and restore the vital functions of lens proteins and enzymes. They found that such regu-

lation was independent of cellular GSH concentration.

[43152] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43153] Padilla, C. A.; Martinez-Galisteo, E.; Barcena, J. A.; Spyrou, G.; Holmgren, A. : Purification from placenta, amino acid sequence, structure comparisons and cDNA cloning of human glutaredoxin. *Europ. J. Biochem.* 227: 27–34, 1995. ; and

[43154] Raghavachari, N.; Krysan, K.; Xing K.; Lou, M. F. : Regulation of thioltransferase expression in human lens epithelial cells. *Invest. Ophthal. Vis. Sci.* 42: 1002–1008, 2001.

[43155] Further studies establishing the function and utilities of GLRX are found in John Hopkins OMIM database record ID 600443, and in cited publications numbered 10219–10221 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lectin, Galactoside-binding, Soluble, 3 Binding Protein (LGALS3BP, Accession XM_045104) is another VGAM1204 host target gene. LGALS3BP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LGALS3BP, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGALS3BP BINDING SITE, designated SEQ ID:34357, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43156] Another function of VGAM1204 is therefore inhibition of Lectin, Galactoside-binding, Soluble, 3 Binding Protein (LGALS3BP, Accession XM_045104). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGALS3BP. Nuclear Receptor Subfamily 4, Group A, Member 1 (NR4A1, Accession NM_002135) is another VGAM1204 host target gene. NR4A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NR4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A1 BINDING SITE, designated SEQ ID:7912, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43157] Another function of VGAM1204 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 1

(NR4A1, Accession NM_002135), a gene which is a member of steroid receptor family and binds DNA. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A1. The function of NR4A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM897. Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594) is another VGAM1204 host target gene. PCSK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCSK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK2 BINDING SITE, designated SEQ ID:8459, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43158] Another function of VGAM1204 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594), a gene which is involved in the processing of hormone and other protein precursors at sites comprised of pairs of basic amino acid residues. Accord-

ingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK2. The function of PCSK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1120. Regulatory Factor X, 1 (influences HLA class II expression) (RFX1, Accession NM_002918) is another VGAM1204 host target gene. RFX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX1 BINDING SITE, designated SEQ ID:8822, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43159] Another function of VGAM1204 is therefore inhibition of Regulatory Factor X, 1 (influences HLA class II expression) (RFX1, Accession NM_002918), a gene which regulates mhc class ii gene expression and also binds to an inverted repeat (enh1) required for hepatitis b virus genes expression. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with RFX1. The function of RFX1 has been established by previous studies. The RFX1 gene product is a transactivator of the human hepatitis B viral enhancer I. Reith et al. (1994) commented that the RFX family members, particularly RFX1 and RFX3 (OMIM Ref. No. 601337), constitute the nuclear complexes referred to previously as enhancer factor C (EF-C), EP, and methylation-dependent DNA-binding protein (MDBP), or rpL30-alpha. Reith et al. (1994) identified and cloned 3 members of this gene family from both human and mouse using lambda gt11 cDNA libraries. Homology between the 3 RFX proteins is restricted largely to 5 conserved regions, including the 2 domains required for DNA binding and dimerization. Reith et al. (1994) found that RFX1, RFX2 (OMIM Ref. No. 142765), and RFX3 have similar DNA-binding specificities. The RFX monomers can heterodimerize both in vivo and in vitro, but all 3 are capable of binding DNA as monomers. They showed that the RFX1 transcript is expressed in many mouse tissues. Emery et al. (1996) reviewed RFX1, RFX5, and other members of the RFX family of DNA binding proteins.

[43160] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [43161] Reith, W.; Ucla, C.; Barras, E.; Gaud, A.; Durand, B.; Her-
rero-Sanchez, C.; Kobr, M.; Mach, B. : RFX1, a transactiva-
tor of hepatitis B virus enhancer I, belongs to a novel fam-
ily of homodimeric and heterodimeric DNA-binding pro-
teins. *Molec. Cell. Biol.* 14: 1230-1244, 1994. ; and
- [43162] Emery, P.; Durand, B.; Mach, B.; Reith, W. : RFX proteins, a
novel family of DNA binding proteins conserved in the eu-
karyotic kingdom. *Nucleic Acids Res.* 24: 803-807, 1996.
- [43163] Further studies establishing the function and utilities of
RFX1 are found in John Hopkins OMIM database record ID
600006, and in cited publications numbered 4745, 8320,
977 and 8318 listed in the bibliography section hereinbe-
low, which are also hereby incorporated by refer-
ence. Sarcosine Dehydrogenase (SARDH, Accession
NM_007101) is another VGAM1204 host target gene.
SARDH BINDING SITE is HOST TARGET binding site found
in the 5' untranslated region of mRNA encoded by
SARDH, corresponding to a HOST TARGET binding site
such as BINDING SITE I, BINDING SITE II or BINDING SITE III.
Table 2 illustrates the complementarity of the nucleotide
sequences of SARDH BINDING SITE, designated SEQ
ID:13961, to the nucleotide sequence of VGAM1204 RNA,

herein designated VGAM RNA, also designated SEQ ID:3915.

[43164] Another function of VGAM1204 is therefore inhibition of Sarcosine Dehydrogenase (SARDH, Accession NM_007101), a gene which oxidatively degrades choline to glycine. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARDH. The function of SARDH has been established by previous studies. Sarcosine dehydrogenase (SARDH; EC 1.5.99.1) is a liver mitochondrial matrix flavoenzyme that catalyzes the oxidative demethylation of sarcosine. SARDH is defective in patients with sarcosinemia (OMIM Ref. No. 268900). By homology searching, Eschenbrenner and Jorns (1999) identified a partial human infant brain SARDH cDNA. Using this partial cDNA, they isolated a full-length human liver cDNA. The predicted 918-amino acid SARDH protein contains a putative 22-amino acid mitochondrial targeting sequence, an ADP-binding site, and a stretch of 12 amino acids that matches the covalent flavin-containing peptide from rat liver Sardh. Human SARDH shares 89% amino acid sequence identity with rat liver Sardh and 34% identity with rat liver dimethylglycine dehydrogenase. Northern blot

analysis of various human adult and fetal tissues detected a 4-kb SARDH transcript at high levels in adult and fetal liver and at lower levels in adult pancreas and kidney and fetal kidney. The SARDH gene spans at least 75.3 kb and contains 21 exons. The authors identified cDNAs corresponding to alternatively spliced and polyadenylated SARDH transcripts. Eschenbrenner and Jorns (1999) identified 3 genomic sequences from 9q34 that contain the SARDH gene. The localization of the human SARDH gene to 9q34 is consistent with genetic studies using a mouse model for sarcosinemia that mapped the mouse *Sardh* gene to a region of chromosome 2 that shows homology of synteny with human 9q33–q34 (Harding et al., 1992; Brunialti et al., 1996).

[43165] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43166] Brunialti, A. L. B.; Harding, C. O.; Wolff, J. A.; Guenet, J.–L. : The mouse mutation sarcosinemia (*sar*) maps to chromosome 2 in a region homologous to human 9q33–q34. *Genomics* 36: 182–184, 1996. ; and

[43167] Eschenbrenner, M.; Jorns, M. S. : Cloning and mapping of the cDNA for human sarcosine dehydrogenase, a flavoen–

zyme defective in patients with sarcosinemia. Genomics 59: 300–308, 1999.

[43168] Further studies establishing the function and utilities of SARDH are found in John Hopkins OMIM database record ID 604455, and in cited publications numbered 9177–4765 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TOX (Accession NM_014729) is another VGAM1204 host target gene. TOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOX BINDING SITE, designated SEQ ID:16327, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43169] Another function of VGAM1204 is therefore inhibition of TOX (Accession NM_014729). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOX. Zinc Finger Protein 278 (ZNF278, Accession NM_032050) is another VGAM1204 host target gene. ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by ZNF278, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3, designated SEQ ID:25776, SEQ ID:25786 and SEQ ID:15627 respectively, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43170] Another function of VGAM1204 is therefore inhibition of Zinc Finger Protein 278 (ZNF278, Accession NM_032050), a gene which represses basal transcription as well as RNF4-mediated activation. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF278. The function of ZNF278 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM414. Chromosome 11 Open Reading Frame 21 (C11orf21, Accession NM_014144) is another VGAM1204 host target gene. C11orf21 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C11orf21, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf21 BINDING SITE, designated SEQ ID:15427, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43171] Another function of VGAM1204 is therefore inhibition of Chromosome 11 Open Reading Frame 21 (C11orf21, Accession NM_014144). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf21. Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418) is another VGAM1204 host target gene. C11orf25 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C11orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf25 BINDING SITE, designated SEQ ID:25399, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43172] Another function of VGAM1204 is therefore inhibition of

Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25. DKFZp434J0226 (Accession XM_051327) is another VGAM1204 host target gene. DKFZp434J0226 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434J0226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434J0226 BINDING SITE, designated SEQ ID:35806, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43173] Another function of VGAM1204 is therefore inhibition of DKFZp434J0226 (Accession XM_051327). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434J0226. FLJ11753 (Accession NM_024659) is another VGAM1204 host target gene. FLJ11753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11753, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11753 BINDING SITE, designated SEQ ID:23963, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43174] Another function of VGAM1204 is therefore inhibition of FLJ11753 (Accession NM_024659). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11753. GW112 (Accession NM_006418) is another VGAM1204 host target gene. GW112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GW112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:13129, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43175] Another function of VGAM1204 is therefore inhibition of GW112 (Accession NM_006418). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GW112. KIAA1644 (Accession XM_097892) is another VGAM1204 host target gene. KIAA1644 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1644 BINDING SITE, designated SEQ ID:41203, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43176] Another function of VGAM1204 is therefore inhibition of KIAA1644 (Accession XM_097892). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1644. MGC20235 (Accession NM_145041) is another VGAM1204 host target gene. MGC20235 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC20235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20235 BINDING SITE, designated SEQ ID:29671, to

the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43177] Another function of VGAM1204 is therefore inhibition of MGC20235 (Accession NM_145041). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20235. Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM_013233) is another VGAM1204 host target gene. STK39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK39 BINDING SITE, designated SEQ ID:14895, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43178] Another function of VGAM1204 is therefore inhibition of Serine Threonine Kinase 39 (STE20/SPS1 homolog, yeast) (STK39, Accession NM_013233). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK39. LOC146146 (Accession XM_085343) is another

VGAM1204 host target gene. LOC146146 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146146 BINDING SITE, designated SEQ ID:38074, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43179] Another function of VGAM1204 is therefore inhibition of LOC146146 (Accession XM_085343). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146146. LOC149448 (Accession XM_097642) is another VGAM1204 host target gene. LOC149448 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149448 BINDING SITE, designated SEQ ID:40990, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43180] Another function of VGAM1204 is therefore inhibition of LOC149448 (Accession XM_097642). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149448. LOC169693 (Accession XM_108998) is another VGAM1204 host target gene. LOC169693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169693 BINDING SITE, designated SEQ ID:42207, to the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, also designated SEQ ID:3915.

[43181] Another function of VGAM1204 is therefore inhibition of LOC169693 (Accession XM_108998). Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169693. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1205 (VGAM1205) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[43182] VGAM1205 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1205 was detected is described hereinabove with reference to Figs. 1–8.

[43183] VGAM1205 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Scallion Virus X. VGAM1205 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43184] VGAM1205 gene encodes a VGAM1205 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1205 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1205 precursor RNA is designated SEQ ID:1191, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1191 is located at position 2547 relative to the genome of Scallion Virus X.

[43185] VGAM1205 precursor RNA folds onto itself, forming VGAM1205 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43186] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1205 folded precursor RNA into VGAM1205 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1205 RNA is designated SEQ ID:3916, and is provided hereinbelow with reference to the sequence listing part.

[43187] VGAM1205 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1205 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43188] VGAM1205 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1205 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1205 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43189] The complementary binding of VGAM1205 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1205 host target RNA into VGAM1205 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43190] It is appreciated that VGAM1205 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1205 host target genes. The mRNA of each one of this plurality of VGAM1205 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1205 RNA, herein designated VGAM RNA, and which when bound by VGAM1205 RNA causes inhibition of translation of respective one or more VGAM1205 host target proteins.

[43191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1205 gene, herein designated VGAM GENE, on one or more VGAM1205 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43192] It is yet further appreciated that a function of VGAM1205 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of viral infection by Scallion Virus X. Specific functions, and accordingly utilities, of VGAM1205 correlate with, and may be deduced from, the identity of the host target genes which VGAM1205 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[43193] Nucleotide sequences of the VGAM1205 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1205 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1205 are further described hereinbelow with reference to Table 1.

[43194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1205 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1205 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43195] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1205 gene, herein designated VGAM is inhibition of expression of VGAM1205 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1205 correlate with, and may be deduced from, the identity of the target genes which VGAM1205 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43196] Aminomethyltransferase (glycine cleavage system protein T) (AMT, Accession NM_000481) is a VGAM1205 host target gene. AMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMT BINDING SITE, designated SEQ ID:6090, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43197] A function of VGAM1205 is therefore inhibition of Aminomethyltransferase (glycine cleavage system protein T) (AMT, Accession NM_000481). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMT.

Development and Differentiation Enhancing Factor 2 (DDEF2, Accession NM_003887) is another VGAM1205 host target gene. DDEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDEF2 BINDING SITE, des-

ignated SEQ ID:9969, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43198] Another function of VGAM1205 is therefore inhibition of Development and Differentiation Enhancing Factor 2 (DDEF2, Accession NM_003887), a gene which interacts with members of the Arf and Src family. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDEF2. The function of DDEF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464. GNAS Complex Locus (GNAS, Accession NM_016592) is another VGAM1205 host target gene. GNAS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAS BINDING SITE, designated SEQ ID:18677, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43199] Another function of VGAM1205 is therefore inhibition of

GNAS Complex Locus (GNAS, Accession NM_016592), a gene which transduces signals from G protein-coupled receptors and activates adenylyl cyclase. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAS. The function of GNAS has been established by previous studies. Because obesity is frequently associated with GS deficiency and GS is part of the pathway transducing the lipolytic signal through beta-adrenergic receptors, Carel et al. (1999) tested whether epinephrine resistance was part of the spectrum of hormonal resistance in patients with GS deficiency. Carel et al. (1999) measured glycerol flux, using a nonradioactive tracer dilution approach, to analyze the lipolytic response to epinephrine in 6 patients with GS deficiency and PTH resistance and compared it in 6 age-matched normal controls and 9 massively obese children. Basal glycerol production was reduced by 50%, and lipolytic response to epinephrine was reduced by 67% in GS-deficient children, as compared with controls. The degree of impairment of lipolysis was similar in GS-deficient children who were only moderately overweight and in morbidly obese children. Animal model experiments lend further support to the function of GNAS.

Yu et al. (1998) generated mice with a null allele of the *Gnas* gene. Homozygous *Gs* deficiency was embryonically lethal. Heterozygotes with maternal ($m-/+$) and paternal ($+/p-$) inheritance of the *Gnas* null allele had distinct phenotypes, suggesting that *Gnas* is an imprinted gene.

Parathyroid hormone (PTH) resistance is present in $m-/+$ but not $+/p-$ mice. Expression of the alpha subunit in the renal cortex (the site of PTH action) was markedly reduced in $m-/+$ but not in $+/p-$ mice, demonstrating that the *Gnas* paternal allele is imprinted in this tissue. *Gnas* was also imprinted in brown and white adipose tissue. The maximal physiologic response to vasopressin (urinary concentrating ability) was normal in both $m-/+$ and $+/p-$ mice and *Gnas* was not imprinted in the renal inner medulla, the site of vasopressin action. Tissue-specific imprinting of *Gnas* was likely the mechanism for variable and tissue-specific hormone resistance in the knockout mice and a similar mechanism might explain the variable phenotype in AHO.

[43200] It is appreciated that the abovementioned animal model for GNAS is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[43201] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43202] Carel, J. C.; Le Stunff, C.; Condamine, L.; Mallet, E.; Chaus-sain, J. L.; Adnot, P.; Garabedian, M.; Bougneres, P. : Re-sistance to the lipolytic action of epinephrine: a new fea-ture of protein GS deficiency. J. Clin. Endocr. Metab. 84: 4127-4131, 1999. ; and

[43203] Yu, S.; Yu, D.; Lee, E.; Eckhaus, M.; Lee, R.; Corria, Z.; Ac-cili, D.; Westphal, H.; Weinstein, L. S. : Variable and tissue-specific hormone resistance in heterotrimeric Gs protein a.

[43204] Further studies establishing the function and utilities of GNAS are found in John Hopkins OMIM database record ID 139320, and in cited publications numbered 11941-11951, 4744, 11952-11957, 12197-12200, 11463, 1394-1393, 1395-1402, 1407-1406, 1408-1415, 1466-1469, 27, 1470-1490, 2301-10 and 28 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hairless Ho-molog (mouse) (HR, Accession NM_005144) is another VGAM1205 host target gene. HR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by HR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HR BINDING SITE, designated SEQ ID:11615, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43205] Another function of VGAM1205 is therefore inhibition of Hairless Homolog (mouse) (HR, Accession NM_005144). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HR. Piccolo (presynaptic cytomatrix protein) (PCLO, Accession XM_168530) is another VGAM1205 host target gene. PCLO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCLO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCLO BINDING SITE, designated SEQ ID:45211, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43206] Another function of VGAM1205 is therefore inhibition of

Piccolo (presynaptic cytomatrix protein) (PCLO, Accession XM_168530), a gene which involves in the cycling of synaptic vesicles. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCLO. The function of PCLO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM_002836) is another VGAM1205 host target gene. PTPRA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTPRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRA BINDING SITE, designated SEQ ID:8716, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43207] Another function of VGAM1205 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM_002836), a gene which is the human homolog of the murine PTPase. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PTPRA. The function of PTPRA has been established by previous studies. Vital cellular functions such as cell proliferation and signal transduction are regulated in part by the balance between the activities of protein-tyrosine kinases (PTK) and protein-tyrosine phosphatases (OMIM Ref. No. PTPase). Oncogenesis can result from an imbalance. There are 2 classes of PTPase molecules: low molecular weight proteins with a single conserved phosphatase domain such as T-cell protein-tyrosine phosphatase (PTPT; 176887), and high molecular weight receptor-linked PTPases with 2 tandemly repeated conserved domains separated by 56 to 57 amino acids. Examples of the latter group include leukocyte-common antigen (PTPRC; 151460) and leukocyte antigen related tyrosine phosphatase (PTPRF; 179590). Matthews et al. (1990) cloned the human homolog of the murine PTPase termed LRP by them. Its cDNA sequence predicted a protein of 793 amino acids with an unglycosylated molecular mass of 87,500 kD Matthews et al. (1990). The protein contains a 121-residue extracellular domain, a single transmembrane segment, and 2 tandem intracytoplasmic catalytic domains. By study of rodent-human somatic cell hybrids,

Jirik et al. (1990) localized PTPA/LRP to chromosome 20p13. Other family members located on chromosome 20 include SRC (OMIM Ref. No. 190090), HCK (OMIM Ref. No. 142370), and PTP1B (OMIM Ref. No. 176885). The LRP protein is ubiquitously expressed and thus likely plays a fundamental role in the physiology of all cells. With a leukocyte common antigen (LCA) probe, Kaplan et al. (1990) sequenced cDNA encoding the alpha enzyme isolated from a human brain stem cDNA library under conditions of reduced hybridization stringency. LRP encodes an 802-amino acid polypeptide. Kaplan et al. (1990) localized the RPTPase-alpha gene to human chromosome 20pter-20q12 by analysis of its segregation pattern in rodent-human somatic cell hybrids. Rao et al. (1992) re-regionalized the assignment of PTPA to the distal portion of 20p (20pter-p12) by both radioactive and fluorescence in situ hybridization. By in situ hybridization, Jirik et al. (1992) localized the PTPA gene to 20p13. With the mapping of PAX1 167411 to mouse chromosome 2, Schnittger et al. (1992) found that the homolog of PTPA is also located on mouse chromosome 2, which confirms the exceptional homology between human chromosome 20 and the distal segment of mouse chromosome 2.

[43208] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43209] Matthews, R. J.; Cahir, E. D.; Thomas, M. L. : Identification of an additional member of the protein-tyrosine-phosphatase family: evidence for alternative splicing in the tyrosine phosphatase domain. Proc. Nat. Acad. Sci. 87: 4444-4448, 1990. ; and

[43210] Schnittger, S.; Rao, V. V. N. G.; Deutsch, U.; Gruss, P.; Balling, R.; Hansmann, I. : PAX1, a member of the paired box-containing class of developmental control genes, is mapped to human ch.

[43211] Further studies establishing the function and utilities of PTPRA are found in John Hopkins OMIM database record ID 176884, and in cited publications numbered 10891-10892, 1089 and 10893-10895 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM_003243) is another VGAM1205 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFBR3 BINDING SITE, designated SEQ ID:9247, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43212] Another function of VGAM1205 is therefore inhibition of Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFBR3, Accession NM_003243), a gene which involves in capturing and retaining TGF-beta for presentation to the signaling receptors. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR3. The function of TGFBR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM139. Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM_001243) is another VGAM1205 host target gene. TNFRSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TNFRSF8 BINDING SITE, designated SEQ ID:6908, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43213] Another function of VGAM1205 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM_001243), a gene which regulates gene expression through activation of nf-kappab. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF8. The function of TNFRSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM154. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919) is another VGAM1205 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE4, designated SEQ ID:17188, SEQ

ID:28469, SEQ ID:28477 and SEQ ID:28452 respectively, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43214] Another function of VGAM1205 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. CLIPR-59 (Accession NM_015526) is another VGAM1205 host target gene. CLIPR-59 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLIPR-59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIPR-59 BINDING SITE, designated SEQ ID:17789, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43215] Another function of VGAM1205 is therefore inhibition of

CLIPR-59 (Accession NM_015526). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIPR-59. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 17, 72kDa (DDX17, Accession NM_030881) is another VGAM1205 host target gene. DDX17 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DDX17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX17 BINDING SITE, designated SEQ ID:25157, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43216] Another function of VGAM1205 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 17, 72kDa (DDX17, Accession NM_030881). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX17. FLJ20452 (Accession NM_017828) is another VGAM1205 host target gene. FLJ20452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20452, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20452 BINDING SITE, designated SEQ ID:19491, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43217] Another function of VGAM1205 is therefore inhibition of FLJ20452 (Accession NM_017828). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20452. FLJ32865 (Accession NM_144613) is another VGAM1205 host target gene. FLJ32865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29432, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43218] Another function of VGAM1205 is therefore inhibition of FLJ32865 (Accession NM_144613). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ32865. KIAA0630 (Accession XM_114729) is another VGAM1205 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:43063, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43219] Another function of VGAM1205 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. KIAA1029 (Accession NM_007286) is another VGAM1205 host target gene. KIAA1029 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1029 BINDING SITE, designated SEQ ID:14146, to the

nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43220] Another function of VGAM1205 is therefore inhibition of KIAA1029 (Accession NM_007286). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1029. MGC10870 (Accession NM_032301) is another VGAM1205 host target gene. MGC10870 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC10870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10870 BINDING SITE, designated SEQ ID:26081, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43221] Another function of VGAM1205 is therefore inhibition of MGC10870 (Accession NM_032301). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10870. MGC26954 (Accession NM_145025) is another VGAM1205 host target gene. MGC26954 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by MGC26954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26954 BINDING SITE, designated SEQ ID:29637, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43222] Another function of VGAM1205 is therefore inhibition of MGC26954 (Accession NM_145025). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26954. MGC4643 (Accession NM_032715) is another VGAM1205 host target gene. MGC4643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:26443, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43223] Another function of VGAM1205 is therefore inhibition of MGC4643 (Accession NM_032715). Accordingly, utilities

of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643. Nucleoporin 160kDa (NUP160, Accession XM_113678) is another VGAM1205 host target gene. NUP160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUP160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP160 BINDING SITE, designated SEQ ID:42329, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43224] Another function of VGAM1205 is therefore inhibition of Nucleoporin 160kDa (NUP160, Accession XM_113678). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP160. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792) is another VGAM1205 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28058, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43225] Another function of VGAM1205 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. RA-GEF-2 (Accession NM_016340) is another VGAM1205 host target gene. RA-GEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RA-GEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RA-GEF-2 BINDING SITE, designated SEQ ID:18467, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43226] Another function of VGAM1205 is therefore inhibition of RA-GEF-2 (Accession NM_016340). Accordingly, utilities

of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2. URG4 (Accession NM_017920) is another VGAM1205 host target gene. URG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by URG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of URG4 BINDING SITE, designated SEQ ID:19579, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43227] Another function of VGAM1205 is therefore inhibition of URG4 (Accession NM_017920). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with URG4. LOC115110 (Accession XM_049825) is another VGAM1205 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC115110 BINDING SITE, designated SEQ ID:35505, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43228] Another function of VGAM1205 is therefore inhibition of LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC147174 (Accession XM_035807) is another VGAM1205 host target gene. LOC147174 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147174 BINDING SITE, designated SEQ ID:32342, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43229] Another function of VGAM1205 is therefore inhibition of LOC147174 (Accession XM_035807). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147174. LOC157376 (Accession XM_088301) is another VGAM1205 host target gene. LOC157376 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157376 BINDING SITE, designated SEQ ID:39600, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43230] Another function of VGAM1205 is therefore inhibition of LOC157376 (Accession XM_088301). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157376. LOC164397 (Accession XM_092780) is another VGAM1205 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40148, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43231] Another function of VGAM1205 is therefore inhibition of

LOC164397 (Accession XM_092780). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164397. LOC202451 (Accession XM_117401) is another VGAM1205 host target gene. LOC202451 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202451 BINDING SITE, designated SEQ ID:43435, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43232] Another function of VGAM1205 is therefore inhibition of LOC220002 (Accession XM_166224). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220002. LOC220002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC220002 BINDING SITE, designated SEQ ID:44049, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43233] Another function of VGAM1205 is therefore inhibition of LOC220002 (Accession XM_166224). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220002. LOC253292 (Accession XM_173082) is another VGAM1205 host target gene. LOC253292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253292 BINDING SITE, designated SEQ ID:46340, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43234] Another function of VGAM1205 is therefore inhibition of LOC253292 (Accession XM_173082). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253292. LOC255294 (Accession XM_170500) is an-

other VGAM1205 host target gene. LOC255294 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255294 BINDING SITE, designated SEQ ID:45337, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43235] Another function of VGAM1205 is therefore inhibition of LOC255294 (Accession XM_170500). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255294. LOC90784 (Accession XM_034109) is another VGAM1205 host target gene. LOC90784 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90784 BINDING SITE, designated SEQ ID:32001, to the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, also designated SEQ ID:3916.

[43236] Another function of VGAM1205 is therefore inhibition of LOC90784 (Accession XM_034109). Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90784. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1206 (VGAM1206) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43237] VGAM1206 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1206 was detected is described hereinabove with reference to Figs. 1–8.

[43238] VGAM1206 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Mosaic Virus. VGAM1206 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43239] VGAM1206 gene encodes a VGAM1206 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1206 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1206 precursor RNA is designated SEQ ID:1192, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1192 is located at position 961 relative to the genome of Clover Yellow Mosaic Virus.

[43240] VGAM1206 precursor RNA folds onto itself, forming VGAM1206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43241] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1206 folded precursor RNA into VGAM1206 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1206 RNA is designated SEQ ID:3917, and is provided hereinbelow with reference to the sequence listing part.

[43242] VGAM1206 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1206 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43243] VGAM1206 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1206 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1206 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43244] The complementary binding of VGAM1206 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1206 host target RNA into VGAM1206 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43245] It is appreciated that VGAM1206 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1206 host target genes. The mRNA of each one of this plurality of VGAM1206 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1206 RNA, herein designated VGAM RNA, and which when bound by VGAM1206 RNA causes inhibition of translation of respective one or more VGAM1206 host target proteins.

[43246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1206 gene, herein designated VGAM GENE, on one or more VGAM1206 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43247] It is yet further appreciated that a function of VGAM1206 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1206 include diagnosis, prevention and treatment of viral infection by Clover Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1206 correlate with, and may be deduced from, the identity of the host target genes which VGAM1206 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43248] Nucleotide sequences of the VGAM1206 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1206 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1206 are further described hereinbelow with reference to Table 1.

[43249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1206 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1206 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[43250] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1206 gene, herein designated VGAM is inhibition of expression of VGAM1206 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1206 correlate with, and may be deduced from, the identity of the target genes which VGAM1206 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43251] Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083) is a VGAM1206 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22056, to the nucleotide sequence of VGAM1206 RNA, herein designated VGAM RNA, also designated SEQ ID:3917.

[43252] A function of VGAM1206 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083). Accordingly, utilities of VGAM1206 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with XK. Programmed Cell Death 7 (PDCD7, Accession XM_050977) is another VGAM1206 host target gene. PDCD7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDCD7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDCD7 BINDING SITE, designated SEQ ID:35695, to the nucleotide sequence of VGAM1206 RNA, herein designated VGAM RNA, also designated SEQ ID:3917.

[43253] Another function of VGAM1206 is therefore inhibition of Programmed Cell Death 7 (PDCD7, Accession XM_050977). Accordingly, utilities of VGAM1206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDCD7. LOC255104 (Accession XM_170911) is another VGAM1206 host target gene. LOC255104 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255104 BINDING SITE, design-

nated SEQ ID:45686, to the nucleotide sequence of VGAM1206 RNA, herein designated VGAM RNA, also designated SEQ ID:3917.

[43254] Another function of VGAM1206 is therefore inhibition of LOC255104 (Accession XM_170911). Accordingly, utilities of VGAM1206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255104. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1207 (VGAM1207) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43255] VGAM1207 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1207 was detected is described hereinabove with reference to Figs. 1–8.

[43256] VGAM1207 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Mosaic Virus. VGAM1207 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43257] VGAM1207 gene encodes a VGAM1207 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1207 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1207 precursor RNA is designated SEQ ID:1193, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1193 is located at position 3847 relative to the genome of Clover Yellow Mosaic Virus.

[43258] VGAM1207 precursor RNA folds onto itself, forming VGAM1207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43259] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1207 folded precursor RNA into VGAM1207 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1207 RNA is designated SEQ ID:3918, and is provided hereinbelow with reference to the sequence listing part.

[43260] VGAM1207 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1207 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43261] VGAM1207 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1207 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1207 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43262] The complementary binding of VGAM1207 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1207 host target RNA into VGAM1207 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43263] It is appreciated that VGAM1207 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1207 host target genes. The mRNA of each one of this plurality of VGAM1207 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1207 RNA, herein designated VGAM RNA, and which when bound by VGAM1207 RNA causes inhibition of translation of respective one or more VGAM1207 host target proteins.

[43264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1207 gene, herein designated VGAM GENE, on one or more VGAM1207 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[43265] It is yet further appreciated that a function of VGAM1207 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1207 include diagnosis, prevention and treatment of viral infection by Clover Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1207 correlate with, and may be deduced from, the identity of the host target genes which VGAM1207 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43266] Nucleotide sequences of the VGAM1207 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1207 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1207 are further described hereinbelow with reference to Table 1.

[43267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1207 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1207 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43268] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1207 gene, herein designated VGAM is inhibition of expression of VGAM1207 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1207 correlate with, and may be deduced from, the identity of the target genes which VGAM1207 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43269] V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM_003036) is a VGAM1207 host target gene. SKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKI BINDING SITE, designated SEQ ID:8986, to the nucleotide sequence of VGAM1207 RNA, herein designated VGAM RNA, also designated SEQ ID:3918.

[43270] A function of VGAM1207 is therefore inhibition of V-ski

Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM_003036). Accordingly, utilities of VGAM1207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKI. DKFZP434O047 (Accession NM_015594) is another VGAM1207 host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17863, to the nucleotide sequence of VGAM1207 RNA, herein designated VGAM RNA, also designated SEQ ID:3918.

[43271] Another function of VGAM1207 is therefore inhibition of DKFZP434O047 (Accession NM_015594). Accordingly, utilities of VGAM1207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. DKFZP761E2110 (Accession NM_030953) is another VGAM1207 host target gene. DKFZP761E2110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761E2110, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761E2110 BINDING SITE, designated SEQ ID:25222, to the nucleotide sequence of VGAM1207 RNA, herein designated VGAM RNA, also designated SEQ ID:3918.

[43272] Another function of VGAM1207 is therefore inhibition of DKFZP761E2110 (Accession NM_030953). Accordingly, utilities of VGAM1207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761E2110. PRO2266 (Accession NM_018519) is another VGAM1207 host target gene. PRO2266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2266 BINDING SITE, designated SEQ ID:20596, to the nucleotide sequence of VGAM1207 RNA, herein designated VGAM RNA, also designated SEQ ID:3918.

[43273] Another function of VGAM1207 is therefore inhibition of PRO2266 (Accession NM_018519). Accordingly, utilities of VGAM1207 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRO2266. ZAK (Accession NM_133646) is another VGAM1207 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:28608, to the nucleotide sequence of VGAM1207 RNA, herein designated VGAM RNA, also designated SEQ ID:3918.

[43274] Another function of VGAM1207 is therefore inhibition of ZAK (Accession NM_133646). Accordingly, utilities of VGAM1207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC147463 (Accession XM_085799) is another VGAM1207 host target gene. LOC147463 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147463 BINDING SITE, designated SEQ ID:38341, to

the nucleotide sequence of VGAM1207 RNA, herein designated VGAM RNA, also designated SEQ ID:3918.

[43275] Another function of VGAM1207 is therefore inhibition of LOC147463 (Accession XM_085799). Accordingly, utilities of VGAM1207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147463. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1208 (VGAM1208) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43276] VGAM1208 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1208 was detected is described hereinabove with reference to Figs. 1–8.

[43277] VGAM1208 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Mosaic Virus. VGAM1208 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43278] VGAM1208 gene encodes a VGAM1208 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1208 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1208 precursor RNA is designated SEQ ID:1194, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1194 is located at position 2694 relative to the genome of Clover Yellow Mosaic Virus.

[43279] VGAM1208 precursor RNA folds onto itself, forming VGAM1208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43280] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1208 folded precursor RNA into VGAM1208 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1208 RNA is designated SEQ ID:3919, and is provided hereinbelow with reference to the sequence listing part.

[43281] VGAM1208 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1208 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43282] VGAM1208 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1208 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1208 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43283] The complementary binding of VGAM1208 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1208 host target RNA into VGAM1208 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43284] It is appreciated that VGAM1208 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1208 host target genes. The mRNA of each one of this plurality of VGAM1208 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1208 RNA, herein designated VGAM RNA, and which when bound by VGAM1208 RNA causes inhibition of translation of respective one or more VGAM1208 host target proteins.

[43285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1208 gene, herein designated VGAM GENE, on one or more VGAM1208 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[43286] It is yet further appreciated that a function of VGAM1208 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of viral infection by Clover Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1208 correlate with, and may be deduced from, the identity of the host target genes which VGAM1208 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43287] Nucleotide sequences of the VGAM1208 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1208 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1208 are further described hereinbelow with reference to Table 1.

[43288] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1208 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1208 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43289] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1208 gene, herein designated VGAM is inhibition of expression of VGAM1208 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1208 correlate with, and may be deduced from, the identity of the target genes which VGAM1208 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43290] BN51 (BHK21) Temperature Sensitivity Complementing (BN51T, Accession XM_113557) is a VGAM1208 host target gene. BN51T BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BN51T, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BN51T BINDING SITE, designated SEQ ID:42282, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43291] A function of VGAM1208 is therefore inhibition of BN51

(BHK21) Temperature Sensitivity Complementing (BN51T, Accession XM_113557), a gene which complements a temperature-sensitive cell cycle mutation in BHK cells. Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BN51T. The function of BN51T and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM592. Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105) is another VGAM1208 host target gene. CLASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP1 BINDING SITE, designated SEQ ID:32538, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43292] Another function of VGAM1208 is therefore inhibition of Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105), a gene which plays a role in the local regulation of microtubule dynamics . Accordingly, utilities

of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP1. The function of CLASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM298. Integrin, Alpha 6 (ITGA6, Accession NM_000210) is another VGAM1208 host target gene. ITGA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA6 BINDING SITE, designated SEQ ID:5699, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43293] Another function of VGAM1208 is therefore inhibition of Integrin, Alpha 6 (ITGA6, Accession NM_000210). Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA6. FLJ20695 (Accession NM_017929) is another VGAM1208 host target gene. FLJ20695 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20695, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20695 BINDING SITE, designated SEQ ID:19611, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43294] Another function of VGAM1208 is therefore inhibition of FLJ20695 (Accession NM_017929). Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20695. KIAA1023 (Accession NM_017604) is another VGAM1208 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19083, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43295] Another function of VGAM1208 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM1208 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1023. LOC114971 (Accession XM_054936) is another VGAM1208 host target gene. LOC114971 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC114971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:36207, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43296] Another function of VGAM1208 is therefore inhibition of LOC114971 (Accession XM_054936). Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114971. LOC155179 (Accession XM_088169) is another VGAM1208 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39551, to

the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43297] Another function of VGAM1208 is therefore inhibition of LOC155179 (Accession XM_088169). Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC201516 (Accession XM_113974) is another VGAM1208 host target gene. LOC201516 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201516 BINDING SITE, designated SEQ ID:42580, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43298] Another function of VGAM1208 is therefore inhibition of LOC201516 (Accession XM_113974). Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201516. LOC222865 (Accession XM_167242) is another VGAM1208 host target gene. LOC222865 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC222865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222865 BINDING SITE, designated SEQ ID:44620, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43299] Another function of VGAM1208 is therefore inhibition of LOC222865 (Accession XM_167242). Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222865. LOC257464 (Accession XM_116972) is another VGAM1208 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43161, to the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, also designated SEQ ID:3919.

[43300] Another function of VGAM1208 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities

of VGAM1208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1209 (VGAM1209) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43301] VGAM1209 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1209 was detected is described hereinabove with reference to Figs. 1-8.

[43302] VGAM1209 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Mosaic Virus. VGAM1209 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43303] VGAM1209 gene encodes a VGAM1209 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1209 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1209 precursor RNA is designated SEQ ID:1195, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1195 is located at position 5426 relative to the genome of Clover Yellow Mosaic Virus.

- [43304] VGAM1209 precursor RNA folds onto itself, forming VGAM1209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43305] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1209 folded precursor RNA into VGAM1209 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1209 RNA is designated SEQ ID:3920, and

is provided hereinbelow with reference to the sequence listing part.

[43306] VGAM1209 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1209 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[43307] VGAM1209 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1209 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1209 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43308] The complementary binding of VGAM1209 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1209 host target RNA into VGAM1209 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43309] It is appreciated that VGAM1209 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1209 host target genes. The mRNA of each one of this plurality of VGAM1209 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1209 RNA, herein designated VGAM RNA, and which when bound by VGAM1209 RNA causes inhibition of translation of respective one or more VGAM1209 host target proteins.

[43310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1209 gene, herein designated VGAM GENE, on one or more VGAM1209 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43311] It is yet further appreciated that a function of VGAM1209 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of viral infection by Clover Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1209 correlate with, and may be deduced from, the identity of the host target genes which VGAM1209 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43312] Nucleotide sequences of the VGAM1209 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1209 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1209 are further described hereinbelow with reference to Table 1.

[43313] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1209 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1209 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43314] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1209 gene, herein designated VGAM is inhibition of expression of VGAM1209 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1209 correlate with, and may be deduced from, the identity of the target genes which VGAM1209 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43315] Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2A (GRIN2A, Accession NM_000833) is a VGAM1209 host target gene. GRIN2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN2A BINDING SITE, designated SEQ ID:6489, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43316] A function of VGAM1209 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2A (GRIN2A, Accession NM_000833), a gene which modulates the efficiency of synaptic plasticity. Accordingly, utilities of VGAM1209 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with GRIN2A. The function of GRIN2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_006481) is another VGAM1209 host target gene. TCF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE, designated SEQ ID:13201, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43317] Another function of VGAM1209 is therefore inhibition of Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_006481), a gene which probably binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF2. The function of TCF2 and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118. Tumor Protein P53 (Li-Fraumeni syndrome) (TP53, Accession NM_000546) is another VGAM1209 host target gene. TP53 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TP53, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53 BINDING SITE, designated SEQ ID:6151, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43318] Another function of VGAM1209 is therefore inhibition of Tumor Protein P53 (Li-Fraumeni syndrome) (TP53, Accession NM_000546). Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53. Tripartite Motif-containing 34 (TRIM34, Accession NM_021616) is another VGAM1209 host target gene. TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRIM34, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2, designated SEQ ID:22249 and SEQ ID:28173 respectively, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43319] Another function of VGAM1209 is therefore inhibition of Tripartite Motif-containing 34 (TRIM34, Accession NM_021616). Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM34. KIAA1016 (Accession XM_166260) is another VGAM1209 host target gene. KIAA1016 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1016 BINDING SITE, designated SEQ ID:44085, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43320] Another function of VGAM1209 is therefore inhibition of KIAA1016 (Accession XM_166260). Accordingly, utilities

of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1016. LEC3 (Accession NM_015236) is another VGAM1209 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17566, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43321] Another function of VGAM1209 is therefore inhibition of LEC3 (Accession NM_015236). Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEC3. MGC22014 (Accession XM_035307) is another VGAM1209 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING

SITE, designated SEQ ID:32217, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43322] Another function of VGAM1209 is therefore inhibition of MGC22014 (Accession XM_035307). Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. Protein-O-mannosyltransferase 1 (POMT1, Accession NM_007171) is another VGAM1209 host target gene. POMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POMT1 BINDING SITE, designated SEQ ID:14016, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43323] Another function of VGAM1209 is therefore inhibition of Protein-O-mannosyltransferase 1 (POMT1, Accession NM_007171). Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMT1. LOC143173

(Accession XM_016685) is another VGAM1209 host target gene. LOC143173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143173 BINDING SITE, designated SEQ ID:30269, to the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, also designated SEQ ID:3920.

[43324] Another function of VGAM1209 is therefore inhibition of LOC143173 (Accession XM_016685). Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143173. LOC202451 (Accession XM_117401) is another VGAM1209 host target gene. LOC202451 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202451 BINDING SITE, designated SEQ ID:43437, to the nucleotide sequence of VGAM1209 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3920.

[43325] Another function of VGAM1209 is therefore inhibition of LOC202451 (Accession XM_117401). Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202451. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1210 (VGAM1210) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43326] VGAM1210 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1210 was detected is described hereinabove with reference to Figs. 1–8.

[43327] VGAM1210 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1210 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43328] VGAM1210 gene encodes a VGAM1210 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1210 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1210 precursor RNA is designated SEQ ID:1196, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1196 is located at position 134784 relative to the genome of Camelpox Virus.

- [43329] VGAM1210 precursor RNA folds onto itself, forming VGAM1210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43330] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1210 folded precursor RNA into VGAM1210 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1210 RNA is designated SEQ ID:3921, and is provided hereinbelow with reference to the sequence listing part.

[43331] VGAM1210 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1210 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43332] VGAM1210 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1210 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1210 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43333] The complementary binding of VGAM1210 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1210 host target RNA into VGAM1210 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43334] It is appreciated that VGAM1210 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1210 host target genes. The mRNA of

each one of this plurality of VGAM1210 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1210 RNA, herein designated VGAM RNA, and which when bound by VGAM1210 RNA causes inhibition of translation of respective one or more VGAM1210 host target proteins.

[43335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1210 gene, herein designated VGAM GENE, on one or more VGAM1210 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[43336] It is yet further appreciated that a function of VGAM1210 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1210 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1210 correlate with, and may be deduced from, the identity of the host target genes which VGAM1210 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43337] Nucleotide sequences of the VGAM1210 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1210 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1210 are further described hereinbelow with reference to Table 1.

[43338] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1210 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1210 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43339] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1210 gene, herein designated VGAM is inhibition of expression of VGAM1210 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1210 correlate with, and may be deduced from, the identity of the target genes which VGAM1210 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43340] BDG-29 (Accession XM_051343) is a VGAM1210 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35816, to the nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, also designated SEQ ID:3921.

[43341] A function of VGAM1210 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM1210 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with BDG-29. Chromosome 21 Open Reading Frame 6 (C21orf6, Accession NM_016940) is another VGAM1210 host target gene. C21orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf6 BINDING SITE, designated SEQ ID:18855, to the nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, also designated SEQ ID:3921.

[43342] Another function of VGAM1210 is therefore inhibition of Chromosome 21 Open Reading Frame 6 (C21orf6, Accession NM_016940). Accordingly, utilities of VGAM1210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf6. DKFZp434D177 (Accession NM_032264) is another VGAM1210 host target gene. DKFZp434D177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434D177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZp434D177 BINDING SITE, designated SEQ ID:26007, to the nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, also designated SEQ ID:3921.

[43343] Another function of VGAM1210 is therefore inhibition of DKFZp434D177 (Accession NM_032264). Accordingly, utilities of VGAM1210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434D177. HSA249128 (Accession NM_017583) is another VGAM1210 host target gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19027, to the nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, also designated SEQ ID:3921.

[43344] Another function of VGAM1210 is therefore inhibition of HSA249128 (Accession NM_017583). Accordingly, utilities of VGAM1210 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with HSA249128. KIAA1634 (Accession XM_032749) is another VGAM1210 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31751, to the nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, also designated SEQ ID:3921.

[43345] Another function of VGAM1210 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM1210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. KIAA1941 (Accession XM_059318) is another VGAM1210 host target gene. KIAA1941 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1941 BINDING SITE, designated SEQ ID:36951, to the

nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, also designated SEQ ID:3921.

[43346] Another function of VGAM1210 is therefore inhibition of KIAA1941 (Accession XM_059318). Accordingly, utilities of VGAM1210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1941. PRO2533 (Accession NM_018629) is another VGAM1210 host target gene. PRO2533 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2533 BINDING SITE, designated SEQ ID:20702, to the nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, also designated SEQ ID:3921.

[43347] Another function of VGAM1210 is therefore inhibition of PRO2533 (Accession NM_018629). Accordingly, utilities of VGAM1210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2533. LOC151201 (Accession XM_098021) is another VGAM1210 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41323, to the nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, also designated SEQ ID:3921.

[43348] Another function of VGAM1210 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM1210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1211 (VGAM1211) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43349] VGAM1211 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1211 was detected is described hereinabove with reference to Figs. 1-8.

[43350] VGAM1211 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox Virus.

VGAM1211 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43351] VGAM1211 gene encodes a VGAM1211 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1211 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1211 precursor RNA is designated SEQ ID:1197, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1197 is located at position 138029 relative to the genome of Camelpox Virus.

[43352] VGAM1211 precursor RNA folds onto itself, forming VGAM1211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43353] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1211 folded precursor RNA into VGAM1211 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1211 RNA is designated SEQ ID:3922, and is provided hereinbelow with reference to the sequence listing part.

[43354] VGAM1211 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1211 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43355] VGAM1211 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1211 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1211 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43356] The complementary binding of VGAM1211 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1211

host target RNA into VGAM1211 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43357] It is appreciated that VGAM1211 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1211 host target genes. The mRNA of each one of this plurality of VGAM1211 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1211 RNA, herein designated VGAM RNA, and which when bound by VGAM1211 RNA causes inhibition of translation of respective one or more VGAM1211 host target proteins.

[43358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1211 gene, herein designated VGAM GENE, on one or more VGAM1211 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43359] It is yet further appreciated that a function of VGAM1211 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1211 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1211 correlate with, and may be deduced from, the identity of the host target genes which VGAM1211 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43360] Nucleotide sequences of the VGAM1211 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1211 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1211 are further

described hereinbelow with reference to Table 1.

[43361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1211 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1211 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43362] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1211 gene, herein designated VGAM is inhibition of expression of VGAM1211 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1211 correlate with, and may be deduced from, the identity of the target genes which VGAM1211 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43363] NDRG Family Member 3 (NDRG3, Accession NM_022477) is a VGAM1211 host target gene. NDRG3 BINDING SITE1 and NDRG3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of NDRG3 BINDING SITE1 and NDRG3 BINDING SITE2, designated SEQ ID:22845 and SEQ ID:25720 respectively, to the nucleotide sequence of VGAM1211 RNA, herein designated VGAM RNA, also designated SEQ ID:3922.

[43364] A function of VGAM1211 is therefore inhibition of NDRG Family Member 3 (NDRG3, Accession NM_022477). Accordingly, utilities of VGAM1211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1212 (VGAM1212) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43365] VGAM1212 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1212 was detected is described hereinabove with reference to Figs. 1-8.

[43366] VGAM1212 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1212 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[43367] VGAM1212 gene encodes a VGAM1212 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1212 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1212 precursor RNA is designated SEQ ID:1198, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1198 is located at position 133579 relative to the genome of Camelpox Virus.

[43368] VGAM1212 precursor RNA folds onto itself, forming VGAM1212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43369] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1212 folded precursor RNA into VGAM1212

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1212 RNA is designated SEQ ID:3923, and is provided hereinbelow with reference to the sequence listing part.

[43370] VGAM1212 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1212 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43371] VGAM1212 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1212 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1212 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43372] The complementary binding of VGAM1212 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1212 host target RNA into VGAM1212 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[43373] It is appreciated that VGAM1212 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1212 host target genes. The mRNA of each one of this plurality of VGAM1212 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1212 RNA, herein designated VGAM RNA, and which when bound by VGAM1212 RNA causes inhibition of translation of respective one or more VGAM1212 host target proteins.

[43374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1212 gene, herein designated VGAM GENE, on one or more VGAM1212 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43375] It is yet further appreciated that a function of VGAM1212 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1212 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1212 correlate with, and may be deduced from, the identity of the host target genes which VGAM1212 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43376] Nucleotide sequences of the VGAM1212 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1212 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1212 are further described hereinbelow with reference to Table 1.

[43377] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1212 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1212 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43378] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1212 gene, herein designated VGAM is inhibition of expression of VGAM1212 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1212 correlate with, and may be deduced from, the identity of the target genes which VGAM1212 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43379] Coagulation Factor III (thromboplastin, tissue factor) (F3, Accession XM_040465) is a VGAM1212 host target gene. F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F3 BINDING SITE, designated SEQ ID:33296, to the nucleotide sequence of VGAM1212 RNA, herein designated

VGAM RNA, also designated SEQ ID:3923.

- [43380] A function of VGAM1212 is therefore inhibition of Coagulation Factor III (thromboplastin, tissue factor) (F3, Accession XM_040465), a gene which functions in normal hemostasis. Accordingly, utilities of VGAM1212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F3. The function of F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM817. Serine/threonine Kinase 6 (STK6, Accession NM_003600) is another VGAM1212 host target gene. STK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK6 BINDING SITE, designated SEQ ID:9654, to the nucleotide sequence of VGAM1212 RNA, herein designated VGAM RNA, also designated SEQ ID:3923.
- [43381] Another function of VGAM1212 is therefore inhibition of Serine/threonine Kinase 6 (STK6, Accession NM_003600), a gene which is serine/threonine kinase 6 which is most

highly expressed during mitosis. Accordingly, utilities of VGAM1212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK6. The function of STK6 has been established by previous studies. Kimura et al. (1997) cloned a cDNA encoding a novel human serine/threonine kinase, STK6, which has high homology with Aurora and Ipl1 kinases. Mutations in these yeast kinases are known to cause abnormal spindle formation and missegregation of chromosomes. Northern and Western blotting analyses revealed a high level of STK6 expression product in testis and proliferating culture cells such as HeLa cells. The endogenous levels of STK6 protein and protein kinase activity were tightly regulated during cell cycle progression in HeLa cells. The protein was upregulated during G2/M and rapidly reduced after mitosis. Immunofluorescence studies revealed specific localization of STK6 protein to the spindle pole region during mitosis. The results suggested that STK6, like Aurora and Ipl1, is involved in cell growth and/or chromosome segregation. By fluorescence in situ hybridization, Kimura et al. (1997) showed that this mitotic centrosomal protein kinase, also referred to as ALK, is represented by 2 signals in chromosome bands 20q13.2-q13.3 and 1q41-q42. So-

matic cell hybrid panel analyses showed that the functional gene is on chromosome 20 and a processed pseudogene (STK6P) on chromosome 1.

[43382] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43383] Kimura, M.; Kotani, S.; Hattori, T.; Sumi, N.; Yoshioka, T.; Todokoro, T.; Okano, Y. : Cell cycle-dependent expression and spindle pole localization of a novel human protein kinase Aik, related to Aurora of *Drosophila* and yeast Ipl1. *J. Biol. Chem.* 272: 13766–13771, 1997. ; and

[43384] Kimura, M.; Matsuda, Y.; Eki, T.; Yoshioka, T.; Okumura, K.; Hanaoka, F.; Okano, Y. : Assignment of STK6 to human chromosome 20q13.2–q13.3 and a pseudogene STK6P to 1q41–q42. *Cytogenet.*

[43385] Further studies establishing the function and utilities of STK6 are found in John Hopkins OMIM database record ID 602687, and in cited publications numbered 6225 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10719 (Accession XM_031328) is another VGAM1212 host target gene. FLJ10719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

FLJ10719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10719 BINDING SITE, designated SEQ ID:31339, to the nucleotide sequence of VGAM1212 RNA, herein designated VGAM RNA, also designated SEQ ID:3923.

[43386] Another function of VGAM1212 is therefore inhibition of FLJ10719 (Accession XM_031328). Accordingly, utilities of VGAM1212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10719. FLJ23323 (Accession NM_024654) is another VGAM1212 host target gene. FLJ23323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23323 BINDING SITE, designated SEQ ID:23953, to the nucleotide sequence of VGAM1212 RNA, herein designated VGAM RNA, also designated SEQ ID:3923.

[43387] Another function of VGAM1212 is therefore inhibition of FLJ23323 (Accession NM_024654). Accordingly, utilities of

VGAM1212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23323. LOC149721 (Accession XM_086649) is another VGAM1212 host target gene. LOC149721 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149721 BINDING SITE, designated SEQ ID:38808, to the nucleotide sequence of VGAM1212 RNA, herein designated VGAM RNA, also designated SEQ ID:3923.

[43388] Another function of VGAM1212 is therefore inhibition of LOC149721 (Accession XM_086649). Accordingly, utilities of VGAM1212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149721. LOC202459 (Accession NM_145303) is another VGAM1212 host target gene. LOC202459 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC202459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC202459 BINDING SITE, designated SEQ ID:29814, to the nucleotide sequence of VGAM1212 RNA, herein designated VGAM RNA, also designated SEQ ID:3923.

[43389] Another function of VGAM1212 is therefore inhibition of LOC202459 (Accession NM_145303). Accordingly, utilities of VGAM1212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202459. LOC254735 (Accession XM_171051) is another VGAM1212 host target gene. LOC254735 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254735 BINDING SITE, designated SEQ ID:45837, to the nucleotide sequence of VGAM1212 RNA, herein designated VGAM RNA, also designated SEQ ID:3923.

[43390] Another function of VGAM1212 is therefore inhibition of LOC254735 (Accession XM_171051). Accordingly, utilities of VGAM1212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254735. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1213 (VGAM1213) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43391] VGAM1213 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1213 was detected is described hereinabove with reference to Figs. 1–8.

[43392] VGAM1213 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Mottle Virus. VGAM1213 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43393] VGAM1213 gene encodes a VGAM1213 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1213 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1213 precursor RNA is designated SEQ ID:1199, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1199 is located at position 4590 relative to the

genome of Strawberry Mottle Virus.

[43394] VGAM1213 precursor RNA folds onto itself, forming VGAM1213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43395] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1213 folded precursor RNA into VGAM1213 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1213 RNA is designated SEQ ID:3924, and is provided hereinbelow with reference to the sequence listing part.

[43396] VGAM1213 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1213 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43397] VGAM1213 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1213 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1213 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43398] The complementary binding of VGAM1213 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1213 host target RNA into VGAM1213 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43399] It is appreciated that VGAM1213 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1213 host target genes. The mRNA of each one of this plurality of VGAM1213 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1213 RNA, herein designated VGAM RNA, and which when bound by VGAM1213 RNA causes inhibition of translation of respective one or more VGAM1213 host target proteins.

[43400] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1213 gene, herein designated VGAM GENE, on one or more VGAM1213 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43401] It is yet further appreciated that a function of VGAM1213 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1213 include diagnosis, prevention and treatment of viral infection by Strawberry Mottle Virus. Specific functions, and accordingly utilities, of VGAM1213

correlate with, and may be deduced from, the identity of the host target genes which VGAM1213 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43402] Nucleotide sequences of the VGAM1213 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1213 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1213 are further described hereinbelow with reference to Table 1.

[43403] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1213 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1213 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43404] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1213 gene, herein designated VGAM is inhibition of expression of VGAM1213 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1213 correlate with, and may be deduced

from, the identity of the target genes which VGAM1213 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43405] Phosphatidylinositol-4-phosphate 5-kinase, Type I, Beta (PIP5K1B, Accession NM_003558) is a VGAM1213 host target gene. PIP5K1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP5K1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1B BINDING SITE, designated SEQ ID:9605, to the nucleotide sequence of VGAM1213 RNA, herein designated VGAM RNA, also designated SEQ ID:3924.

[43406] A function of VGAM1213 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type I, Beta (PIP5K1B, Accession NM_003558), a gene which catalyses the phosphorylation of phosphatidylinositol-4-phosphate to form phosphatidylinositol-4,5-bisphosphate. Accordingly, utilities of VGAM1213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1B. The function of PIP5K1B has been established by previous studies. Carvajal et al. (1995) re-

ported the isolation of a gene from the region of the genome associated with Friedreich ataxia (FRDA; 229300). Expression was found to be complex, with multiple transcripts detected in a variety of tissues and evidence of alternative splicing and developmental control. The predicted amino acid sequence for the 2.7-kb transcript showed a marked homology to the deduced amino acid sequence of the MSS4 protein of *Saccharomyces cerevisiae*, which had been proposed to function in the phosphoinositide cycle, thus suggesting a potential role for the human homolog in signal transduction. Although no evidence of mutation was detected in the transcript, the sequence (which they designated STM7.I) represented only one of the shorter alternatively spliced species identified by Northern analysis and direct sequencing. Carvajal et al. (1996) reported that the X25 (frataxin-encoding) gene described by Campuzano et al. (1996) and shown to be associated with mutations in FRDA patients comprises part of a gene that they had previously identified and named STM7. They reported that the transcription of both STM7 and X25 occurs from the centromere toward the telomere, that the reported sequences of STM7 and X25 did not represent a full-length transcript, that multiple transcripts

for each of these genes are present in Northern blots, and that several of these transcripts are of similar size. Carvajal et al. (1996) also reported that less than 10 kb separates the CpG island identified in the X25/exon 1 from the 3-prime end of STM7/exon 16. They further demonstrated that the recombinant protein corresponding to the STM7.1 transcript has phosphatidylinositol-4-phosphate 5-kinase activity. See 606829 for further discussion of the relationship between STM7 and FRDA.

[43407] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43408] Campuzano, V.; Montermini, L.; Molto, M. D.; Pianese, L.; Cossee, M.; Cavalcanti, F.; Monros, E.; Rodius, F.; Duclos, F.; Monticelli, A.; Zara, F.; Canizares, J.; Koutnikova, H.; Bidichandani, S. I.; Gellera, C.; Brice, A.; Trouillas, P.; De Michele, G.; Filla, A.; De Frutos, R.; Palau, F.; Patel, P. I.; Di Donato, S.; Mandel, J. -L.; Coccozza, S.; Koenig, M.; Pandolfo, M. : Friedreich's ataxia: autosomal recessive disease caused by an intronic GAA triplet repeat expansion. *Science* 271: 1423-1427, 1996. ; and

[43409] Carvajal, J. J.; Pook, M. A.; dos Santos, M.; Doudney, K.; Hillermann, R.; Minogue, S.; Williamson, R.; Hsuan, J. J.;

Chamberlain, S. : The Friedreich's ataxia gene encodes a novel phos.

[43410] Further studies establishing the function and utilities of PIP5K1B are found in John Hopkins OMIM database record ID 602745, and in cited publications numbered 8277–2401 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1463 (Accession XM_051160) is another VGAM1213 host target gene. KIAA1463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:35767, to the nucleotide sequence of VGAM1213 RNA, herein designated VGAM RNA, also designated SEQ ID:3924.

[43411] Another function of VGAM1213 is therefore inhibition of KIAA1463 (Accession XM_051160). Accordingly, utilities of VGAM1213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463. RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM_032918) is another

VGAM1213 host target gene. RERG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RERG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERG BINDING SITE, designated SEQ ID:26737, to the nucleotide sequence of VGAM1213 RNA, herein designated VGAM RNA, also designated SEQ ID:3924.

[43412] Another function of VGAM1213 is therefore inhibition of RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM_032918). Accordingly, utilities of VGAM1213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERG. LOC221474 (Accession XM_166464) is another VGAM1213 host target gene. LOC221474 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221474 BINDING SITE, designated SEQ ID:44378, to the nucleotide sequence of VGAM1213 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3924.

[43413] Another function of VGAM1213 is therefore inhibition of LOC221474 (Accession XM_166464). Accordingly, utilities of VGAM1213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221474. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1214 (VGAM1214) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43414] VGAM1214 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1214 was detected is described hereinabove with reference to Figs. 1–8.

[43415] VGAM1214 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1214 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43416] VGAM1214 gene encodes a VGAM1214 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1214 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1214 precursor RNA is designated SEQ ID:1200, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1200 is located at position 190571 relative to the genome of Tupaia Herpesvirus.

- [43417] VGAM1214 precursor RNA folds onto itself, forming VGAM1214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43418] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1214 folded precursor RNA into VGAM1214 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1214 RNA is designated SEQ ID:3925, and is provided hereinbelow with reference to the sequence listing part.

[43419] VGAM1214 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1214 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43420] VGAM1214 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1214 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1214 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43421] The complementary binding of VGAM1214 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1214 host target RNA into VGAM1214 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43422] It is appreciated that VGAM1214 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1214 host target genes. The mRNA of

each one of this plurality of VGAM1214 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1214 RNA, herein designated VGAM RNA, and which when bound by VGAM1214 RNA causes inhibition of translation of respective one or more VGAM1214 host target proteins.

[43423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1214 gene, herein designated VGAM GENE, on one or more VGAM1214 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[43424] It is yet further appreciated that a function of VGAM1214 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1214 correlate with, and may be deduced from, the identity of the host target genes which VGAM1214 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43425] Nucleotide sequences of the VGAM1214 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1214 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1214 are further described hereinbelow with reference to Table 1.

[43426] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1214 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1214 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43427] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1214 gene, herein designated VGAM is inhibition of expression of VGAM1214 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1214 correlate with, and may be deduced from, the identity of the target genes which VGAM1214 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43428] Dystrophia Myotonica-protein Kinase (DMPK, Accession NM_004409) is a VGAM1214 host target gene. DMPK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMPK BINDING SITE, designated SEQ ID:10667, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43429] A function of VGAM1214 is therefore inhibition of Dystrophia Myotonica-protein Kinase (DMPK, Accession NM_004409). Accordingly, utilities of VGAM1214 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DMPK. EphA8 (EPHA8, Accession NM_020526) is another VGAM1214 host target gene. EPHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA8 BINDING SITE, designated SEQ ID:21744, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43430] Another function of VGAM1214 is therefore inhibition of EphA8 (EPHA8, Accession NM_020526), a gene which encodes Eph-related receptor tyrosine kinase A8. Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA8. The function of EPHA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM494. Fanconi Anemia, Complementation Group A (FANCA, Accession NM_000135) is another VGAM1214 host target gene. FANCA BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCA BINDING SITE, designated SEQ ID:5630, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43431] Another function of VGAM1214 is therefore inhibition of Fanconi Anemia, Complementation Group A (FANCA, Accession NM_000135). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCA. GLI-Kruppel Family Member GLI2 (GLI2, Accession NM_030379) is another VGAM1214 host target gene. GLI2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GLI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLI2 BINDING SITE, designated SEQ ID:24936, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43432] Another function of VGAM1214 is therefore inhibition of GLI-Kruppel Family Member GLI2 (GLI2, Accession NM_030379), a gene which may promote tax-dependent transcription of T-cell leukemia virus type 1 genes. Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLI2. The function of GLI2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM465. Homeo Box D1 (HOXD1, Accession NM_024501) is another VGAM1214 host target gene. HOXD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD1 BINDING SITE, designated SEQ ID:23696, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43433] Another function of VGAM1214 is therefore inhibition of Homeo Box D1 (HOXD1, Accession NM_024501), a gene which is part of a developmental regulatory system . Ac-

cordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD1. The function of HOXD1 has been established by previous studies. Both children studied by Del Campo et al. (1999) were heterozygous for a deletion that eliminated at least 8 (HOXD3–HOXD13) of the 9 genes in the HOXD cluster. Del Campo et al. (1999) suspected that the entire cluster was deleted and that the deletion included the proximally adjacent HOXD–complex gene EVX2 (OMIM Ref. No. 142991). The hypothesis that haploinsufficiency for HOXD–cluster genes was responsible in part for the malformations was supported by the expression patterns of these genes in early vertebrate embryos. However, the involvement of additional genes in the region could explain the discordance, in severity, between the 2 patients and the milder, nonpolarized phenotypes present in mice hemizygous for HoxD cluster genes. Del Campo et al. (1999) noted that mutations in HOXD13 (OMIM Ref. No. 142989) are responsible for type II syndactyly (OMIM Ref. No. 186000). Zakany et al. (2001) showed that Hoxd1 and other Hox genes in the mouse display dynamic stripes of expression within presomitic mesoderm. They stated that the underlying transcriptional

bursts may reflect the mechanism that coordinates Hox gene activation with somitogenesis. This mechanism appeared to depend upon Notch signaling, as mice deficient for Rbpjk (OMIM Ref. No. 147183), the effector of the Notch pathway, showed severely reduced Hoxd gene expression in presomitic mesoderm. These results suggested a molecular link between Hox gene activation and the segmentation clock. Such a linkage would efficiently keep in phase the production of novel segments with their morphologic specification.

[43434] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43435] Del Campo, M.; Jones, M. C.; Veraksa, A. N.; Curry, C. J.; Jones, K. L.; Mascarello, J. T.; Ali-Kahn-Catts, Z.; Drumheller, T.; McGinnis, W. : Monodactylous limbs and abnormal genitalia are associated with hemizygosity for the human 2q31 region that includes the HOXD cluster. Am. J. Hum. Genet. 65: 104–110, 1999. ; and

[43436] Zakany, J.; Kmita, M.; Alarcon, P.; de la Pompa, J.-L.; Duboule, D. : Localized and transient transcription of Hox genes suggests a link between patterning and the segmentation clock.

[43437] Further studies establishing the function and utilities of HOXD1 are found in John Hopkins OMIM database record ID 142987, and in cited publications numbered 11321–11322 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kruppel-like Factor 8 (KLF8, Accession NM_007250) is another VGAM1214 host target gene. KLF8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KLF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF8 BINDING SITE, designated SEQ ID:14123, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43438] Another function of VGAM1214 is therefore inhibition of Kruppel-like Factor 8 (KLF8, Accession NM_007250). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF8. LENG4 (Accession NM_024298) is another VGAM1214 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LENG4, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23581, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43439] Another function of VGAM1214 is therefore inhibition of LENG4 (Accession NM_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259. Neurofibromin 1 (neurofibromatosis, von Recklinghausen disease, Watson disease) (NF1, Accession NM_000267) is another VGAM1214 host target gene. NF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NF1 BINDING SITE, designated SEQ ID:5812, to the nu-

cleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43440] Another function of VGAM1214 is therefore inhibition of Neurofibromin 1 (neurofibromatosis, von Recklinghausen disease, Watson disease) (NF1, Accession NM_000267). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NF1. 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187) is another VGAM1214 host target gene. OAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS3 BINDING SITE, designated SEQ ID:12859, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43441] Another function of VGAM1214 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of

VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS3. The function of OAS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309. Phosphodiesterase 4A, CAMP-specific (phosphodiesterase E2 dunce homolog, Drosophila) (PDE4A, Accession NM_006202) is another VGAM1214 host target gene. PDE4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4A BINDING SITE, designated SEQ ID:12876, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43442] Another function of VGAM1214 is therefore inhibition of Phosphodiesterase 4A, CAMP-specific (phosphodiesterase E2 dunce homolog, Drosophila) (PDE4A, Accession NM_006202), a gene which is a CAMP-specific phosphodiesterase. Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PDE4A. The function of PDE4A has been established by previous studies. See 600128. Livi et al. (1990) isolated a cDNA for a cyclic AMP phosphodiesterase from human monocytes. Obernolte et al. (1993) identified the monocyte clone as the homolog of rat Pde4a. Milatovich et al. (1994) assigned the PDE4A gene to human chromosome 19 by Southern analysis of somatic cell hybrid lines and to mouse chromosome 9 by Southern analysis of recombinant inbred (RI) mouse strains. Horton et al. (1995) confirmed the localization of PDE4A to chromosome 19 by analysis of a human/hamster somatic cell hybrid panel and using fluorescence in situ hybridization, regionalized the gene to 19p13.2-q12. The full-length clone for PDE4A was reported by Bolger et al. (1993). The difference in sequence within the 5-prime region of the open reading frame reported by Bolger et al. (1993) and Livi et al. (1990) was examined by Sullivan et al. (1994), who confirmed the Bolger sequence. Wilson et al. (1994) characterized the enzyme.

[43443] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43444] Milatovich, A.; Bolger, G.; Michaeli, T.; Francke, U. : Chro-

mosome localizations of genes for five cAMP-specific phosphodiesterases in man and mouse. Somat. Cell Molec. Genet. 20: 75–86, 1994. ; and

[43445] Bolger, G.; Michaeli, T.; Martins, T.; St. John, T.; Steiner, B.; Rodgers, L.; Riggs, M.; Wigler, M.; Ferguson, K. : A family of human phosphodiesterases homologous to the dunce learning.

[43446] Further studies establishing the function and utilities of PDE4A are found in John Hopkins OMIM database record ID 600126, and in cited publications numbered 4888–134 and 12445–1344 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 24 (sodium/potassium/calcium exchanger), Member 1 (SLC24A1, Accession NM_004727) is another VGAM1214 host target gene. SLC24A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC24A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC24A1 BINDING SITE, designated SEQ ID:11102, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43447] Another function of VGAM1214 is therefore inhibition of Solute Carrier Family 24 (sodium/potassium/calcium exchanger), Member 1 (SLC24A1, Accession NM_004727), a gene which is a critical component of the visual transduction cascade, controlling the calcium concentration of outer segments during light and darkness. Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC24A1. The function of SLC24A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM142. Angiotensin II Receptor-like 2 (AGTRL2, Accession NM_005162) is another VGAM1214 host target gene. AGTRL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AGTRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGTRL2 BINDING SITE, designated SEQ ID:11645, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43448] Another function of VGAM1214 is therefore inhibition of

Angiotensin II Receptor-like 2 (AGTRL2, Accession NM_005162). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGTRL2. Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837) is another VGAM1214 host target gene. C1orf16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE, designated SEQ ID:16854, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43449] Another function of VGAM1214 is therefore inhibition of Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16. Chromosome 21 Open Reading Frame 93 (C21orf93, Accession NM_145179) is another VGAM1214 host target gene. C21orf93 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

C21orf93, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf93 BINDING SITE, designated SEQ ID:29740, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43450] Another function of VGAM1214 is therefore inhibition of Chromosome 21 Open Reading Frame 93 (C21orf93, Accession NM_145179). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf93. Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM1214 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21607, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43451] Another function of VGAM1214 is therefore inhibition of

Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. DKFZP434H132 (Accession XM_057020) is another VGAM1214 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36447, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43452] Another function of VGAM1214 is therefore inhibition of DKFZP434H132 (Accession XM_057020). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. DKFZP434I216 (Accession XM_085381) is another VGAM1214 host target gene. DKFZP434I216 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434I216, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I216 BINDING SITE, designated SEQ ID:38100, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43453] Another function of VGAM1214 is therefore inhibition of DKFZP434I216 (Accession XM_085381). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I216. DKFZP586G1122 (Accession XM_028643) is another VGAM1214 host target gene. DKFZP586G1122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586G1122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586G1122 BINDING SITE, designated SEQ ID:30726, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43454] Another function of VGAM1214 is therefore inhibition of DKFZP586G1122 (Accession XM_028643). Accordingly,

utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586G1122. DKFZP761E2110 (Accession NM_030953) is another VGAM1214 host target gene. DKFZP761E2110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761E2110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761E2110 BINDING SITE, designated SEQ ID:25224, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43455] Another function of VGAM1214 is therefore inhibition of DKFZP761E2110 (Accession NM_030953). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761E2110. FLJ22746 (Accession NM_024785) is another VGAM1214 host target gene. FLJ22746 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ22746 BINDING SITE, designated SEQ ID:24164, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43456] Another function of VGAM1214 is therefore inhibition of FLJ22746 (Accession NM_024785). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22746. FLJ23022 (Accession NM_025051) is another VGAM1214 host target gene. FLJ23022 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23022 BINDING SITE, designated SEQ ID:24646, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43457] Another function of VGAM1214 is therefore inhibition of FLJ23022 (Accession NM_025051). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23022. FLJ23420 (Accession NM_025061) is another

VGAM1214 host target gene. FLJ23420 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23420 BINDING SITE, designated SEQ ID:24660, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43458] Another function of VGAM1214 is therefore inhibition of FLJ23420 (Accession NM_025061). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23420. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625) is another VGAM1214 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUSIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ ID:13410, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3925.

[43459] Another function of VGAM1214 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. KIAA0152 (Accession NM_014730) is another VGAM1214 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16340, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43460] Another function of VGAM1214 is therefore inhibition of KIAA0152 (Accession NM_014730). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. KIAA0930 (Accession XM_047214) is another VGAM1214 host target gene. KIAA0930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0930 BINDING SITE, designated SEQ ID:34916, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43461] Another function of VGAM1214 is therefore inhibition of KIAA0930 (Accession XM_047214). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0930. KIAA1029 (Accession NM_007286) is another VGAM1214 host target gene. KIAA1029 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1029 BINDING SITE, designated SEQ ID:14143, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43462] Another function of VGAM1214 is therefore inhibition of KIAA1029 (Accession NM_007286). Accordingly, utilities

of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1029. KIAA1157 (Accession XM_051093) is another VGAM1214 host target gene. KIAA1157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1157 BINDING SITE, designated SEQ ID:35749, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43463] Another function of VGAM1214 is therefore inhibition of KIAA1157 (Accession XM_051093). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1157. KIAA1602 (Accession XM_035497) is another VGAM1214 host target gene. KIAA1602 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1602 BINDING SITE, designated SEQ ID:32277, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43464] Another function of VGAM1214 is therefore inhibition of KIAA1602 (Accession XM_035497). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1602. KIAA1656 (Accession XM_038022) is another VGAM1214 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32736, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43465] Another function of VGAM1214 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. KIAA1854 (Accession XM_049884) is another VGAM1214 host target gene. KIAA1854 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35526, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43466] Another function of VGAM1214 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM_033392) is another VGAM1214 host target gene. MAPK8IP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK8IP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK8IP3 BINDING SITE, designated SEQ ID:27218, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43467] Another function of VGAM1214 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM_033392). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK8IP3. Mesoderm Development Candidate 2 (MESDC2, Accession XM_051854) is another VGAM1214 host target gene. MESDC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MESDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:35891, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43468] Another function of VGAM1214 is therefore inhibition of Mesoderm Development Candidate 2 (MESDC2, Accession XM_051854). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2. MSE55 (Accession NM_007061) is another VGAM1214 host target gene. MSE55 BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by MSE55, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSE55 BINDING SITE, designated SEQ ID:13924, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43469] Another function of VGAM1214 is therefore inhibition of MSE55 (Accession NM_007061). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSE55. N4BP3 (Accession XM_038920) is another VGAM1214 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32931, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43470] Another function of VGAM1214 is therefore inhibition of

N4BP3 (Accession XM_038920). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. PRIC285 (Accession XM_028918) is another VGAM1214 host target gene. PRIC285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRIC285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRIC285 BINDING SITE, designated SEQ ID:30802, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43471] Another function of VGAM1214 is therefore inhibition of PRIC285 (Accession XM_028918). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRIC285. RASD Family, Member 2 (RASD2, Accession NM_014310) is another VGAM1214 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ ID:15601, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43472] Another function of VGAM1214 is therefore inhibition of RASD Family, Member 2 (RASD2, Accession NM_014310). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. Transmembrane 4 Superfamily Member 11 (plasmolipin) (TM4SF11, Accession NM_015993) is another VGAM1214 host target gene. TM4SF11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TM4SF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF11 BINDING SITE, designated SEQ ID:18085, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43473] Another function of VGAM1214 is therefore inhibition of Transmembrane 4 Superfamily Member 11 (plasmolipin)

(TM4SF11, Accession NM_015993). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF11. Trinucleotide Repeat Containing 9 (TNRC9, Accession XM_049037) is another VGAM1214 host target gene. TNRC9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TNRC9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC9 BINDING SITE, designated SEQ ID:35321, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43474] Another function of VGAM1214 is therefore inhibition of Trinucleotide Repeat Containing 9 (TNRC9, Accession XM_049037). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC9. ZNF340 (Accession XM_097701) is another VGAM1214 host target gene. ZNF340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF340, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF340 BINDING SITE, designated SEQ ID:41032, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43475] Another function of VGAM1214 is therefore inhibition of ZNF340 (Accession XM_097701). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF340. LOC127281 (Accession XM_059128) is another VGAM1214 host target gene. LOC127281 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127281 BINDING SITE, designated SEQ ID:36890, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43476] Another function of VGAM1214 is therefore inhibition of LOC127281 (Accession XM_059128). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC127281. LOC143153 (Accession XM_084440) is another VGAM1214 host target gene. LOC143153 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143153 BINDING SITE, designated SEQ ID:37581, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43477] Another function of VGAM1214 is therefore inhibition of LOC143153 (Accession XM_084440). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143153. LOC143196 (Accession XM_096389) is another VGAM1214 host target gene. LOC143196 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143196 BINDING SITE, designated SEQ ID:40330, to

the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43478] Another function of VGAM1214 is therefore inhibition of LOC143196 (Accession XM_096389). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143196. LOC144600 (Accession XM_096639) is another VGAM1214 host target gene. LOC144600 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144600 BINDING SITE, designated SEQ ID:40448, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43479] Another function of VGAM1214 is therefore inhibition of LOC144600 (Accession XM_096639). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144600. LOC147093 (Accession XM_097184) is another VGAM1214 host target gene. LOC147093 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC147093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147093 BINDING SITE, designated SEQ ID:40800, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43480] Another function of VGAM1214 is therefore inhibition of LOC147093 (Accession XM_097184). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147093. LOC149566 (Accession XM_097670) is another VGAM1214 host target gene. LOC149566 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149566 BINDING SITE, designated SEQ ID:41015, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43481] Another function of VGAM1214 is therefore inhibition of LOC149566 (Accession XM_097670). Accordingly, utilities

of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149566. LOC151171 (Accession XM_087116) is another VGAM1214 host target gene. LOC151171 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151171 BINDING SITE, designated SEQ ID:39066, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43482] Another function of VGAM1214 is therefore inhibition of LOC151171 (Accession XM_087116). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151171. LOC163682 (Accession XM_099402) is another VGAM1214 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC163682 BINDING SITE, designated SEQ ID:42098, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43483] Another function of VGAM1214 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC164714 (Accession XM_104657) is another VGAM1214 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42183, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43484] Another function of VGAM1214 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC203260 (Accession XM_114661) is another VGAM1214 host target gene. LOC203260 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203260 BINDING SITE, designated SEQ ID:43023, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43485] Another function of VGAM1214 is therefore inhibition of LOC203260 (Accession XM_114661). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203260. LOC204254 (Accession XM_118581) is another VGAM1214 host target gene. LOC204254 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204254 BINDING SITE, designated SEQ ID:43582, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43486] Another function of VGAM1214 is therefore inhibition of

LOC204254 (Accession XM_118581). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204254. LOC205095 (Accession XM_119820) is another VGAM1214 host target gene. LOC205095 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC205095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205095 BINDING SITE, designated SEQ ID:43602, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43487] Another function of VGAM1214 is therefore inhibition of LOC205095 (Accession XM_119820). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205095. LOC254617 (Accession XM_173236) is another VGAM1214 host target gene. LOC254617 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254617 BINDING SITE, designated SEQ ID:46518, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43488] Another function of VGAM1214 is therefore inhibition of LOC254617 (Accession XM_173236). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254617. LOC255299 (Accession XM_173564) is another VGAM1214 host target gene. LOC255299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255299 BINDING SITE, designated SEQ ID:46547, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43489] Another function of VGAM1214 is therefore inhibition of LOC255299 (Accession XM_173564). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255299. LOC256946 (Accession XM_170543) is an-

other VGAM1214 host target gene. LOC256946 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256946 BINDING SITE, designated SEQ ID:45360, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43490] Another function of VGAM1214 is therefore inhibition of LOC256946 (Accession XM_170543). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256946. LOC51152 (Accession NM_016181) is another VGAM1214 host target gene. LOC51152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51152 BINDING SITE, designated SEQ ID:18283, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43491] Another function of VGAM1214 is therefore inhibition of LOC51152 (Accession NM_016181). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51152. LOC91963 (Accession XM_041902) is another VGAM1214 host target gene. LOC91963 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91963 BINDING SITE, designated SEQ ID:33626, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43492] Another function of VGAM1214 is therefore inhibition of LOC91963 (Accession XM_041902). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91963. LOC92230 (Accession XM_043733) is another VGAM1214 host target gene. LOC92230 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92230, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92230 BINDING SITE, designated SEQ ID:34006, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43493] Another function of VGAM1214 is therefore inhibition of LOC92230 (Accession XM_043733). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92230. LOC93259 (Accession XM_050105) is another VGAM1214 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:35560, to the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, also designated SEQ ID:3925.

[43494] Another function of VGAM1214 is therefore inhibition of LOC93259 (Accession XM_050105). Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC93259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1215 (VGAM1215) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43495] VGAM1215 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1215 was detected is described hereinabove with reference to Figs. 1–8.

[43496] VGAM1215 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1215 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43497] VGAM1215 gene encodes a VGAM1215 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1215 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1215 precursor RNA is designated SEQ ID:1201, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1201 is located at position 188394 relative to the genome of Tupaia Herpesvirus.

- [43498] VGAM1215 precursor RNA folds onto itself, forming VGAM1215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43499] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1215 folded precursor RNA into VGAM1215 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM1215 RNA is designated SEQ ID:3926, and is provided hereinbelow with reference to the sequence listing part.

[43500] VGAM1215 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1215 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[43501] VGAM1215 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1215 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1215 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43502] The complementary binding of VGAM1215 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1215 host target RNA into VGAM1215 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43503] It is appreciated that VGAM1215 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1215 host target genes. The mRNA of each one of this plurality of VGAM1215 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1215 RNA, herein designated VGAM RNA, and which when bound by VGAM1215 RNA causes

inhibition of translation of respective one or more VGAM1215 host target proteins.

[43504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1215 gene, herein designated VGAM GENE, on one or more VGAM1215 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43505] It is yet further appreciated that a function of VGAM1215 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1215 include diagnosis, prevention and

treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1215 correlate with, and may be deduced from, the identity of the host target genes which VGAM1215 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43506] Nucleotide sequences of the VGAM1215 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1215 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1215 are further described hereinbelow with reference to Table 1.

[43507] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1215 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1215 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43508] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1215 gene, herein designated VGAM is inhibition of expression of VGAM1215 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1215 correlate with, and may be deduced from, the identity of the target genes which VGAM1215 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43509] Fibromodulin (FMOD, Accession NM_002023) is a VGAM1215 host target gene. FMOD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FMOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMOD BINDING SITE, designated SEQ ID:7771, to the nucleotide sequence of VGAM1215 RNA, herein designated VGAM RNA, also designated SEQ ID:3926.

[43510] A function of VGAM1215 is therefore inhibition of Fibromodulin (FMOD, Accession NM_002023), a gene which affects the rate of fibrils formation. Accordingly, utilities of VGAM1215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMOD. The function of FMOD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM39.NDRG Family Member 3 (NDRG3, Accession NM_022477) is another VGAM1215 host target gene. NDRG3 BINDING SITE1 and NDRG3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG3 BINDING SITE1 and NDRG3 BINDING SITE2, designated SEQ ID:22846 and SEQ ID:25722 respectively, to the nucleotide sequence of VGAM1215 RNA, herein designated VGAM RNA, also designated SEQ ID:3926.

[43511] Another function of VGAM1215 is therefore inhibition of NDRG Family Member 3 (NDRG3, Accession NM_022477). Accordingly, utilities of VGAM1215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG3. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733) is another VGAM1215 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ ID:39931, to the nucleotide sequence of VGAM1215 RNA, herein designated VGAM RNA, also designated SEQ ID:3926.

[43512] Another function of VGAM1215 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733). Accordingly, utilities of VGAM1215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. LOC150150 (Accession XM_097820) is another VGAM1215 host target gene. LOC150150 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150150 BINDING SITE, designated SEQ ID:41134, to the nucleotide sequence of VGAM1215 RNA, herein designated VGAM RNA, also designated SEQ ID:3926.

[43513] Another function of VGAM1215 is therefore inhibition of LOC150150 (Accession XM_097820). Accordingly, utilities of VGAM1215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150150. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1216 (VGAM1216) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43514] VGAM1216 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1216 was detected is described hereinabove with reference to Figs. 1–8.

[43515] VGAM1216 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1216 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43516] VGAM1216 gene encodes a VGAM1216 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1216 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1216 precursor RNA is designated SEQ ID:1202, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1202 is located at position 190154 relative to the genome of Tupaia Herpesvirus.

- [43517] VGAM1216 precursor RNA folds onto itself, forming VGAM1216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43518] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1216 folded precursor RNA into VGAM1216 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1216 RNA is designated SEQ ID:3927, and is provided hereinbelow with reference to the sequence listing part.

[43519] VGAM1216 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1216 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43520] VGAM1216 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1216 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1216 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43521] The complementary binding of VGAM1216 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1216 host target RNA into VGAM1216 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43522] It is appreciated that VGAM1216 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1216 host target genes. The mRNA of each one of this plurality of VGAM1216 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1216 RNA, herein designated VGAM RNA, and which when bound by VGAM1216 RNA causes

inhibition of translation of respective one or more VGAM1216 host target proteins.

[43523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1216 gene, herein designated VGAM GENE, on one or more VGAM1216 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43524] It is yet further appreciated that a function of VGAM1216 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1216 include diagnosis, prevention and

treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1216 correlate with, and may be deduced from, the identity of the host target genes which VGAM1216 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43525] Nucleotide sequences of the VGAM1216 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1216 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1216 are further described hereinbelow with reference to Table 1.

[43526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1216 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1216 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43527] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1216 gene, herein designated VGAM is inhibition of expression of VGAM1216 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1216 correlate with, and may be deduced from, the identity of the target genes which VGAM1216 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43528] Attractin (ATRN, Accession NM_139321) is a VGAM1216 host target gene. ATRN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:29302, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43529] A function of VGAM1216 is therefore inhibition of Attractin (ATRN, Accession NM_139321), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN. The function of ATRN and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to

VGAM53.UDP-Gal:betaGlcNAc Beta

1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_033173) is another VGAM1216 host target gene. B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE5, designated SEQ ID:27038, SEQ ID:27023, SEQ ID:27028, SEQ ID:27033 and SEQ ID:12700 respectively, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43530] Another function of VGAM1216 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_033173). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT5. Chromosome Condensation 1-like (CHC1L, Accession NM_001268) is another VGAM1216 host target gene. CHC1L BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by CHC1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHC1L BINDING SITE, designated SEQ ID:6929, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43531] Another function of VGAM1216 is therefore inhibition of Chromosome Condensation 1-like (CHC1L, Accession NM_001268). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHC1L. Cystinosis, Nephropathic (CTNS, Accession NM_004937) is another VGAM1216 host target gene. CTNS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNS BINDING SITE, designated SEQ ID:11385, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43532] Another function of VGAM1216 is therefore inhibition of Cystinosis, Nephropathic (CTNS, Accession NM_004937). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNS. Cytochrome P450, Subfamily IIIA, Polypeptide 43 (CYP3A43, Accession NM_057096) is another VGAM1216 host target gene. CYP3A43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP3A43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP3A43 BINDING SITE, designated SEQ ID:27663, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43533] Another function of VGAM1216 is therefore inhibition of Cytochrome P450, Subfamily IIIA, Polypeptide 43 (CYP3A43, Accession NM_057096), a gene which may be involved in the metabolism of insect hormones and in the breakdown of synthetic insecticides. Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP3A43. The function of CYP3A43 has been established

by previous studies. By use of PCR on liver cDNA and 3-prime RACE, Domanski et al. (2001) isolated a cDNA encoding CYP3A43, a novel cytochrome P450 IIIA isoform. Sequence analysis predicted that the 503-amino acid protein differs from the other forms at the N terminus as well as at 2 C-terminal conserved sites and 4 sites that are important for the regioselectivity of steroid hydroxylation. RNA dot-blot analysis detected only weak expression in liver, whereas PCR of cDNA panels found expression in liver, kidney, pancreas, and prostate as well as fetal liver and fetal skeletal muscle. SDS-PAGE and Western blot analysis showed expression of an approximately 55-kD protein. Functional analysis indicated that, under appropriate conditions, CYP3A43 exhibits low but reproducible testosterone 6-beta-hydroxylase activity. Gellner et al. (2001) found the highest expression level of CYP3A43 mRNA in prostate, an organ with extensive steroid metabolism. It was also expressed in several other tissues including liver, where it could be induced by rifampicin. By EST database searching and 5-prime RACE, Westlind et al. (2001) also obtained a cDNA encoding CYP3A43. The deduced protein is 76%, 76%, and 72% identical to CYP3A4, CYP3A5, and CYP3A7, respectively. Real-time PCR in 10

different livers revealed that CYP3A43 is expressed at 0.1% and 2% of the levels of CYP3A4 and CYP3A5.

[43534] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43535] Gellner, K.; Eiselt, R.; Hustert, E.; Arnold, H.; Koch, I.; Haberl, M.; Deglmann, C. J.; Burk, O.; Buntefuss, D.; Escher, S.; Bishop, C.; Koebe, H.-G.; Brinkmann, U.; Klenk, H.-P.; Kleine, K.; Meyer, U. A.; Wojnowski, L. : Genomic organization of the human CYP3A locus: identification of a new, inducible CYP3A gene. *Pharmacogenetics* 11: 111-121, 2001. ; and

[43536] Westlind, A.; Malmebo, S.; Johansson, I.; Otter, C.; Andersson, T. B.; Ingelman-Sundberg, M.; Oscarson, M. : Cloning and tissue distribution of a novel human cytochrome P450 of the CYP3.

[43537] Further studies establishing the function and utilities of CYP3A43 are found in John Hopkins OMIM database record ID 606534, and in cited publications numbered 6463-6465 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dystrobrevin, Alpha (DTNA, Accession NM_001391) is another VGAM1216 host target gene. DTNA BINDING

SITE1 through DTNA BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DTNA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTNA BINDING SITE1 through DTNA BINDING SITE4, designated SEQ ID:7084, SEQ ID:26841, SEQ ID:26851 and SEQ ID:26846 respectively, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43538] Another function of VGAM1216 is therefore inhibition of Dystrobrevin, Alpha (DTNA, Accession NM_001391), a gene which may be involved in the formation and stability of synapses. Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTNA. The function of DTNA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1021. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is another VGAM1216 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7738, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43539] Another function of VGAM1216 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990) is another VGAM1216 host target gene. GABRE BINDING SITE1 through GABRE BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABRE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of GABRE BINDING SITE1 through GABRE BINDING SITE4, designated SEQ ID:22533, SEQ ID:22511, SEQ ID:22515 and SEQ ID:11409 respectively, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43540] Another function of VGAM1216 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRE. The function of GABRE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM_003243) is another VGAM1216 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TGFBR3 BINDING SITE, designated SEQ ID:9249, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43541] Another function of VGAM1216 is therefore inhibition of Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFBR3, Accession NM_003243), a gene which involves in capturing and retaining TGF-beta for presentation to the signaling receptors. Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR3. The function of TGFBR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM139. Adenylate Kinase 5 (AK5, Accession NM_012093) is another VGAM1216 host target gene. AK5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AK5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK5 BINDING SITE, designated SEQ ID:14395, to the nucleotide sequence of VGAM1216 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3927.

[43542] Another function of VGAM1216 is therefore inhibition of Adenylate Kinase 5 (AK5, Accession NM_012093). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK5. Basic Helix-loop-helix Domain Containing, Class B, 2 (BHLHB2, Accession NM_003670) is another VGAM1216 host target gene. BHLHB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHLHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHLHB2 BINDING SITE, designated SEQ ID:9755, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43543] Another function of VGAM1216 is therefore inhibition of Basic Helix-loop-helix Domain Containing, Class B, 2 (BHLHB2, Accession NM_003670). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHLHB2. Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749) is another VGAM1216

host target gene. C20orf139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf139 BINDING SITE, designated SEQ ID:41108, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43544] Another function of VGAM1216 is therefore inhibition of Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf139. FLJ13782 (Accession NM_024915) is another VGAM1216 host target gene. FLJ13782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13782 BINDING SITE, designated SEQ ID:24435, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM

RNA, also designated SEQ ID:3927.

[43545] Another function of VGAM1216 is therefore inhibition of FLJ13782 (Accession NM_024915). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13782. FLJ20151 (Accession NM_017689) is another VGAM1216 host target gene. FLJ20151 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20151 BINDING SITE, designated SEQ ID:19245, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43546] Another function of VGAM1216 is therefore inhibition of FLJ20151 (Accession NM_017689). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20151. FLJ22329 (Accession NM_024656) is another VGAM1216 host target gene. FLJ22329 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22329, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22329 BINDING SITE, designated SEQ ID:23959, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43547] Another function of VGAM1216 is therefore inhibition of FLJ22329 (Accession NM_024656). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22329. HTCD37 (Accession XM_041884) is another VGAM1216 host target gene. HTCD37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTCD37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTCD37 BINDING SITE, designated SEQ ID:33619, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43548] Another function of VGAM1216 is therefore inhibition of HTCD37 (Accession XM_041884). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HTCD37. KIAA0295 (Accession XM_042833) is another VGAM1216 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:33784, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43549] Another function of VGAM1216 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0483 (Accession NM_015176) is another VGAM1216 host target gene. KIAA0483 BINDING SITE1 and KIAA0483 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0483, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0483 BINDING SITE1 and KIAA0483

BINDING SITE2, designated SEQ ID:17529 and SEQ ID:17527 respectively, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43550] Another function of VGAM1216 is therefore inhibition of KIAA0483 (Accession NM_015176). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0483. KIAA0934 (Accession XM_034536) is another VGAM1216 host target gene. KIAA0934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0934 BINDING SITE, designated SEQ ID:32120, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43551] Another function of VGAM1216 is therefore inhibition of KIAA0934 (Accession XM_034536). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0934. KIAA1522 (Accession XM_036299) is another

VGAM1216 host target gene. KIAA1522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:32416, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43552] Another function of VGAM1216 is therefore inhibition of KIAA1522 (Accession XM_036299). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1522. KIAA1530 (Accession XM_042661) is another VGAM1216 host target gene. KIAA1530 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:33731, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43553] Another function of VGAM1216 is therefore inhibition of KIAA1530 (Accession XM_042661). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530. KIAA1908 (Accession XM_055834) is another VGAM1216 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36332, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43554] Another function of VGAM1216 is therefore inhibition of KIAA1908 (Accession XM_055834). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. MKP-7 (Accession XM_039106) is another VGAM1216 host target gene. MKP-7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKP-7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKP-7 BINDING SITE, designated SEQ ID:33005, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43555] Another function of VGAM1216 is therefore inhibition of MKP-7 (Accession XM_039106). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKP-7. Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540) is another VGAM1216 host target gene. NCOA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA2 BINDING SITE, designated SEQ ID:13296, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43556] Another function of VGAM1216 is therefore inhibition of Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540). Accordingly, utilities of VGAM1216 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA2. Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM_007229) is another VGAM1216 host target gene. PACSIN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACSIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN2 BINDING SITE, designated SEQ ID:14098, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43557] Another function of VGAM1216 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM_007229). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN2. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession XM_170929) is another VGAM1216 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4DIP, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:45709, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43558] Another function of VGAM1216 is therefore inhibition of Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession XM_170929). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. Serine Hydrolase-like (SERHL, Accession XM_170987) is another VGAM1216 host target gene. SERHL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERHL BINDING SITE, designated SEQ ID:45758, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43559] Another function of VGAM1216 is therefore inhibition of

Serine Hydrolase-like (SERHL, Accession XM_170987). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERHL. UMP-CMPK (Accession NM_016308) is another VGAM1216 host target gene. UMP-CMPK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UMP-CMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UMP-CMPK BINDING SITE, designated SEQ ID:18428, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43560] Another function of VGAM1216 is therefore inhibition of UMP-CMPK (Accession NM_016308). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UMP-CMPK. Ubiquitin Specific Protease 22 (USP22, Accession XM_042698) is another VGAM1216 host target gene. USP22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP22, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP22 BINDING SITE, designated SEQ ID:33753, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43561] Another function of VGAM1216 is therefore inhibition of Ubiquitin Specific Protease 22 (USP22, Accession XM_042698). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP22. LOC128954 (Accession XM_066252) is another VGAM1216 host target gene. LOC128954 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC128954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128954 BINDING SITE, designated SEQ ID:37321, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43562] Another function of VGAM1216 is therefore inhibition of LOC128954 (Accession XM_066252). Accordingly, utilities

of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128954. LOC133926 (Accession XM_059674) is another VGAM1216 host target gene. LOC133926 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133926 BINDING SITE, designated SEQ ID:37060, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43563] Another function of VGAM1216 is therefore inhibition of LOC133926 (Accession XM_059674). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133926. LOC146756 (Accession XM_097085) is another VGAM1216 host target gene. LOC146756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146756 BINDING SITE, designated SEQ ID:40734, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43564] Another function of VGAM1216 is therefore inhibition of LOC146756 (Accession XM_097085). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146756. LOC147632 (Accession NM_138478) is another VGAM1216 host target gene. LOC147632 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147632 BINDING SITE, designated SEQ ID:28827, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43565] Another function of VGAM1216 is therefore inhibition of LOC147632 (Accession NM_138478). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147632. LOC152343 (Accession XM_087441) is another VGAM1216 host target gene. LOC152343 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152343 BINDING SITE, designated SEQ ID:39263, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43566] Another function of VGAM1216 is therefore inhibition of LOC152343 (Accession XM_087441). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152343. LOC220514 (Accession XM_017498) is another VGAM1216 host target gene. LOC220514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220514 BINDING SITE, designated SEQ ID:30322, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43567] Another function of VGAM1216 is therefore inhibition of

LOC220514 (Accession XM_017498). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220514. LOC254015 (Accession XM_172977) is another VGAM1216 host target gene. LOC254015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254015 BINDING SITE, designated SEQ ID:46242, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43568] Another function of VGAM1216 is therefore inhibition of LOC254015 (Accession XM_172977). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254015. LOC257464 (Accession XM_116972) is another VGAM1216 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43169, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43569] Another function of VGAM1216 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. LOC91813 (Accession XM_040862) is another VGAM1216 host target gene. LOC91813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91813 BINDING SITE, designated SEQ ID:33398, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43570] Another function of VGAM1216 is therefore inhibition of LOC91813 (Accession XM_040862). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91813. LOC92181 (Accession XM_043394) is another

VGAM1216 host target gene. LOC92181 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92181 BINDING SITE, designated SEQ ID:33944, to the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, also designated SEQ ID:3927.

[43571] Another function of VGAM1216 is therefore inhibition of LOC92181 (Accession XM_043394). Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92181. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1217 (VGAM1217) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43572] VGAM1217 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1217 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[43573] VGAM1217 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus.

VGAM1217 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43574] VGAM1217 gene encodes a VGAM1217 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1217 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1217 precursor RNA is designated SEQ ID:1203, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1203 is located at position 190840 relative to the genome of Tupaia Herpesvirus.

[43575] VGAM1217 precursor RNA folds onto itself, forming VGAM1217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43576] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1217 folded precursor RNA into VGAM1217 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1217 RNA is designated SEQ ID:3928, and is provided hereinbelow with reference to the sequence listing part.

[43577] VGAM1217 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1217 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43578] VGAM1217 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1217 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1217 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43579] The complementary binding of VGAM1217 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1217 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1217 host target RNA into VGAM1217 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43580] It is appreciated that VGAM1217 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1217 host target genes. The mRNA of each one of this plurality of VGAM1217 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1217 RNA, herein designated VGAM RNA, and which when bound by VGAM1217 RNA causes inhibition of translation of respective one or more VGAM1217 host target proteins.

[43581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1217 gene, herein designated VGAM GENE, on one or more VGAM1217 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43582] It is yet further appreciated that a function of VGAM1217 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1217 correlate with, and may be deduced from, the identity of the host target genes which VGAM1217 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43583] Nucleotide sequences of the VGAM1217 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1217 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1217 are further described hereinbelow with reference to Table 1.

[43584] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1217 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1217 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43585] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1217 gene, herein designated VGAM is inhibition of expression of VGAM1217 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1217 correlate with, and may be deduced from, the identity of the target genes which VGAM1217 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43586] V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM_005157) is a VGAM1217 host target gene. ABL1 BINDING SITE1 and ABL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABL1, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABL1 BINDING SITE1 and ABL1 BINDING SITE2, designated SEQ ID:11637 and SEQ ID:14226 respectively, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43587] A function of VGAM1217 is therefore inhibition of V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM_005157). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABL1. Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586) is another VGAM1217 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15951, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43588] Another function of VGAM1217 is therefore inhibition of

Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM_014586). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM_000598) is another VGAM1217 host target gene. IGFBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGFBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP3 BINDING SITE, designated SEQ ID:6197, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43589] Another function of VGAM1217 is therefore inhibition of Insulin-like Growth Factor Binding Protein 3 (IGFBP3, Accession NM_000598). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP3. Interleukin 10 Receptor, Alpha (IL10RA, Accession XM_006447) is another VGAM1217 host target gene. IL10RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by IL10RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL10RA BINDING SITE, designated SEQ ID:29999, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43590] Another function of VGAM1217 is therefore inhibition of Interleukin 10 Receptor, Alpha (IL10RA, Accession XM_006447), a gene which is a receptor for il-10. Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL10RA. The function of IL10RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM134. Insulin Receptor Substrate 2 (IRS2, Accession XM_007095) is another VGAM1217 host target gene. IRS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IRS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS2 BINDING SITE, desig-

nated SEQ ID:30033, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43591] Another function of VGAM1217 is therefore inhibition of Insulin Receptor Substrate 2 (IRS2, Accession XM_007095), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS2. The function of IRS2 has been established by previous studies. The protein IRS1 (OMIM Ref. No. 147545) acts as an interface between signaling proteins with Src homology-2 domains (SH2 proteins) and the receptors for insulin (INS; 176730), IGF2 (OMIM Ref. No. 147470), growth hormone (GH1; 139250), several interleukins (IL4, 147780; IL9, 146931; IL13, 147683), and other cytokines. It regulates gene expression and stimulates mitogenesis and appears to mediate insulin/IGF1-stimulated glucose transport. Thus, the finding that survival of the homozygous *Irs1* knockout mouse with only mild resistance to hypertension was surprising. This dilemma was provisionally resolved by the discovery by Sun et al. (1995) of a second IRS signaling protein in mouse. They purified and

cloned a likely candidate from mouse myeloid progenitor cells and, because of its resemblance to IRS1, they designated it IRS2. Alignment of the sequences of IRS2 and IRS1 demonstrated a highly conserved N terminus containing a pleckstrin-homology domain and a phosphotyrosine-binding (PTB) domain, and a poorly conserved C terminus containing several tyrosine phosphorylation motifs. IRS2 is expressed in many cells, including tissues from the homozygous IRS1 knockout mouse. Sun et al. (1995) suggested that IRS2 may be essential for signaling by several receptor systems. Mammarella et al. (2000) genotyped 193 Italian patients with type II diabetes (OMIM Ref. No. 125853) and 206 control subjects for the IRS2 G1057D polymorphism (600797.0001). They found evidence for a strong association between type II diabetes and the polymorphism, which appears to be protective against type II diabetes in a codominant fashion. Animal model experiments lend further support to the function of IRS2. Tobe et al. (2001) observed that *Irs2*-deficient mice (Kubota et al. (2000)) showed increased adiposity with increased serum leptin level, suggesting leptin resistance before the mice developed diabetes. Using oligonucleotide microarray and Northern blot analyses to analyze gene expres-

sion, Tobe et al. (2001) detected increased expression of SREBP1, a downstream target of insulin, in Irs2-deficient mouse liver. Using high dose leptin administration, They provided evidence that leptin resistance in Irs2-deficient mice is causally related to SREBP1 gene induction. The authors concluded that Irs2 gene disruption results in leptin resistance, causing SREBP1 gene induction, obesity, fatty liver, and diabetes

[43592] It is appreciated that the abovementioned animal model for IRS2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[43593] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43594] Sun, X. J.; Wang, L.-M.; Zhang, Y.; Yenush, L.; Myers, M. G., Jr.; Glasheen, E.; Lane, W. S.; Pierce, J. H.; White, M. F. : Role of IRS-2 in insulin and cytokine signalling. Nature 377: 173-177, 1995. ; and

[43595] Tobe, K.; Suzuki, R.; Aoyama, M.; Yamauchi, T.; Kamon, J.; Kubota, N.; Terauchi, Y.; Matsui, J.; Akanuma, Y.; Kimura, S.; Tanaka, J.; Abe, M.; Ohsumi, J.; Nagai, R.; Kadowaki, T. : Incre.

[43596] Further studies establishing the function and utilities of IRS2 are found in John Hopkins OMIM database record ID 600797, and in cited publications numbered 135, 1615–1617, 12223, 1085 and 12640–1620 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leucine Zipper Protein 1 (LUZP1, Accession NM_033631) is another VGAM1217 host target gene. LUZP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LUZP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LUZP1 BINDING SITE, designated SEQ ID:27352, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43597] Another function of VGAM1217 is therefore inhibition of Leucine Zipper Protein 1 (LUZP1, Accession NM_033631). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LUZP1. Mannose Receptor, C Type 1 (MRC1, Accession NM_002438) is another VGAM1217 host target gene. MRC1 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by MRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRC1 BINDING SITE, designated SEQ ID:8281, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43598] Another function of VGAM1217 is therefore inhibition of Mannose Receptor, C Type 1 (MRC1, Accession NM_002438), a gene which mediates the endocytosis of glycoproteins. Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRC1. The function of MRC1 has been established by previous studies. Recognition of complex carbohydrate structures plays an important role in a number of biologic processes, including cell-cell recognition, serum glycoprotein turnover, and neutralization of pathogens (Kim et al., 1992). Many of the endogenous animal lectins which mediate these recognition events share a common Ca^{2+} -dependent structural motif, which has been designated a C-type carbohydrate-recognition domain (CRD). The mannose receptor found

on macrophages and on endothelial cells of the liver is the only known example of a C-type lectin that contains multiple C-type CRDs. One function of the receptor is to bind high-mannose structures on the surface of potentially pathogenic viruses, bacteria, and fungi, so that they can be neutralized by phagocytic engulfment. Animal model experiments lend further support to the function of MRC1. Lee et al. (2002) generated mice genetically deficient in mannose receptor. MR $-/-$ mice were defective in clearing proteins bearing accessible mannose and N-acetylglucosamine residues and had elevated levels of 8 different lysosomal hydrolases. Proteomic analysis of MR $-/-$ and control mouse sera showed that an additional 4 out of 52 proteins identified were elevated in MR $-/-$ serum. Each of these proteins is upregulated during inflammation and wound healing. Thus, Lee et al. (2002) concluded that MR appears to operate as an essential regulator of serum glycoprotein homeostasis. The proteins upregulated during inflammation included C-terminal propeptide domains of the pro- α -1 and -2 chains of type I procollagen (120150 and 120160, respectively) and the pro- α -1 chain of type III procollagen (OMIM Ref. No. 120180), as well as fetuin-B (OMIM Ref. No. 605954).

Lee et al. (2002) demonstrated that the mannose receptor is required for rapid clearance of a subset of mannose-bearing serum glycoproteins that are normally elevated during inflammation, but it does not appear to regulate the initiation of inflammation.

[43599] It is appreciated that the abovementioned animal model for MRC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[43600] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43601] Kim, S. J.; Ruiz, N.; Bezouska, K.; Drickamer, K. : Organization of the gene encoding the human macrophage mannose receptor (MRC1). *Genomics* 14: 721–727, 1992. ; and

[43602] Lee, S. J.; Evers, S.; Roeder, D.; Parlow, A. F.; Risteli, J.; Risteli, L.; Lee, Y. C.; Feizi, T.; Langen, H.; Nussenzweig, M. C. : Mannose receptor-mediated regulation of serum glycopr.

[43603] Further studies establishing the function and utilities of MRC1 are found in John Hopkins OMIM database record ID 153618, and in cited publications numbered

11538–11541 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 38 (ZNF38, Accession XM_170135) is another VGAM1217 host target gene. ZNF38 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF38 BINDING SITE, designated SEQ ID:45311, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43604] Another function of VGAM1217 is therefore inhibition of Zinc Finger Protein 38 (ZNF38, Accession XM_170135). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF38. Aminoadipate-semialdehyde Dehydrogenase-phosphopantetheinyl Transferase (AASDHPPT, Accession NM_015423) is another VGAM1217 host target gene. AASDHPPT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AASDHPPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AASDHPPT BINDING SITE, designated SEQ ID:17725, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43605] Another function of VGAM1217 is therefore inhibition of Aminoadipate-semialdehyde Dehydrogenase-phosphopantetheinyl Transferase (AASDHPPT, Accession NM_015423). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AASDHPPT. Chromosome 20 Open Reading Frame 81 (C20orf81, Accession NM_022760) is another VGAM1217 host target gene. C20orf81 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf81, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf81 BINDING SITE, designated SEQ ID:23003, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43606] Another function of VGAM1217 is therefore inhibition of

Chromosome 20 Open Reading Frame 81 (C20orf81, Accession NM_022760). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf81. CDT1 (Accession XM_085327) is another VGAM1217 host target gene. CDT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT1 BINDING SITE, designated SEQ ID:38065, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43607] Another function of VGAM1217 is therefore inhibition of CDT1 (Accession XM_085327). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT1. DKFZP586A0522 (Accession NM_014033) is another VGAM1217 host target gene. DKFZP586A0522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586A0522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZP586A0522 BINDING SITE, designated SEQ ID:15263, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43608] Another function of VGAM1217 is therefore inhibition of DKFZP586A0522 (Accession NM_014033). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586A0522. DKFZp586I021 (Accession NM_032271) is another VGAM1217 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26029, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43609] Another function of VGAM1217 is therefore inhibition of DKFZp586I021 (Accession NM_032271). Accordingly, utilities of VGAM1217 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp586I021. FLJ10261 (Accession NM_018043) is another VGAM1217 host target gene. FLJ10261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10261 BINDING SITE, designated SEQ ID:19788, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43610] Another function of VGAM1217 is therefore inhibition of FLJ10261 (Accession NM_018043). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10261. FLJ13855 (Accession NM_023079) is another VGAM1217 host target gene. FLJ13855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13855 BINDING SITE, designated SEQ ID:23344, to the nucleotide

sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43611] Another function of VGAM1217 is therefore inhibition of FLJ13855 (Accession NM_023079). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13855. FLJ14451 (Accession NM_032786) is another VGAM1217 host target gene. FLJ14451 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14451 BINDING SITE, designated SEQ ID:26540, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43612] Another function of VGAM1217 is therefore inhibition of FLJ14451 (Accession NM_032786). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14451. Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM_014424) is another VGAM1217 host target gene. HSPB7 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPB7 BINDING SITE, designated SEQ ID:15783, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43613] Another function of VGAM1217 is therefore inhibition of Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM_014424). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPB7. KIAA0211 (Accession NM_014630) is another VGAM1217 host target gene. KIAA0211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0211 BINDING SITE, designated SEQ ID:15993, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43614] Another function of VGAM1217 is therefore inhibition of KIAA0211 (Accession NM_014630). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0211. KIAA0546 (Accession XM_049055) is another VGAM1217 host target gene. KIAA0546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0546 BINDING SITE, designated SEQ ID:35333, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43615] Another function of VGAM1217 is therefore inhibition of KIAA0546 (Accession XM_049055). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0546. KIAA0710 (Accession NM_014871) is another VGAM1217 host target gene. KIAA0710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0710, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0710 BINDING SITE, designated SEQ ID:16993, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43616] Another function of VGAM1217 is therefore inhibition of KIAA0710 (Accession NM_014871). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0710. KIAA1045 (Accession XM_048592) is another VGAM1217 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35205, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43617] Another function of VGAM1217 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1045. KIAA1423 (Accession XM_029703) is another VGAM1217 host target gene. KIAA1423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:30922, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43618] Another function of VGAM1217 is therefore inhibition of KIAA1423 (Accession XM_029703). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1423. MGC2628 (Accession NM_024076) is another VGAM1217 host target gene. MGC2628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2628 BINDING SITE, designated SEQ ID:23507, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM

RNA, also designated SEQ ID:3928.

[43619] Another function of VGAM1217 is therefore inhibition of MGC2628 (Accession NM_024076). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2628. MGC3020 (Accession NM_024048) is another VGAM1217 host target gene. MGC3020 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3020 BINDING SITE, designated SEQ ID:23484, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43620] Another function of VGAM1217 is therefore inhibition of MGC3020 (Accession NM_024048). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3020. MSP (Accession NM_032046) is another VGAM1217 host target gene. MSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSP, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSP BINDING SITE, designated SEQ ID:25761, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43621] Another function of VGAM1217 is therefore inhibition of MSP (Accession NM_032046). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSP. Ubiquitin Specific Protease 3 (USP3, Accession XM_116973) is another VGAM1217 host target gene. USP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by USP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP3 BINDING SITE, designated SEQ ID:43171, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43622] Another function of VGAM1217 is therefore inhibition of Ubiquitin Specific Protease 3 (USP3, Accession XM_116973). Accordingly, utilities of VGAM1217 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with USP3. LOC131873 (Accession XM_067585) is another VGAM1217 host target gene. LOC131873 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC131873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:37363, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43623] Another function of VGAM1217 is therefore inhibition of LOC131873 (Accession XM_067585). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873. LOC145231 (Accession XM_096740) is another VGAM1217 host target gene. LOC145231 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145231 BINDING SITE, designated SEQ ID:40521, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43624] Another function of VGAM1217 is therefore inhibition of LOC145231 (Accession XM_096740). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231. LOC146237 (Accession XM_096954) is another VGAM1217 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40670, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43625] Another function of VGAM1217 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237. LOC146713 (Accession XM_097071) is another VGAM1217 host target gene. LOC146713 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146713 BINDING SITE, designated SEQ ID:40717, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43626] Another function of VGAM1217 is therefore inhibition of LOC146713 (Accession XM_097071). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146713. LOC147664 (Accession XM_085826) is another VGAM1217 host target gene. LOC147664 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147664 BINDING SITE, designated SEQ ID:38351, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43627] Another function of VGAM1217 is therefore inhibition of

LOC147664 (Accession XM_085826). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147664. LOC151031 (Accession XM_103784) is another VGAM1217 host target gene. LOC151031 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151031 BINDING SITE, designated SEQ ID:42156, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43628] Another function of VGAM1217 is therefore inhibition of LOC151031 (Accession XM_103784). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151031. LOC166341 (Accession XM_093804) is another VGAM1217 host target gene. LOC166341 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC166341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC166341 BINDING SITE, designated SEQ ID:40211, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43629] Another function of VGAM1217 is therefore inhibition of LOC166341 (Accession XM_093804). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166341. LOC196529 (Accession XM_113746) is another VGAM1217 host target gene. LOC196529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196529 BINDING SITE, designated SEQ ID:42410, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43630] Another function of VGAM1217 is therefore inhibition of LOC196529 (Accession XM_113746). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196529. LOC205313 (Accession XM_119628) is an-

other VGAM1217 host target gene. LOC205313 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205313 BINDING SITE, designated SEQ ID:43593, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43631] Another function of VGAM1217 is therefore inhibition of LOC205313 (Accession XM_119628). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205313. LOC253612 (Accession XM_172985) is another VGAM1217 host target gene. LOC253612 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253612 BINDING SITE, designated SEQ ID:46256, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43632] Another function of VGAM1217 is therefore inhibition of LOC253612 (Accession XM_172985). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253612. LOC256683 (Accession XM_172321) is another VGAM1217 host target gene. LOC256683 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256683, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256683 BINDING SITE, designated SEQ ID:46070, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43633] Another function of VGAM1217 is therefore inhibition of LOC256683 (Accession XM_172321). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256683. LOC90288 (Accession XM_030669) is another VGAM1217 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31111, to the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, also designated SEQ ID:3928.

[43634] Another function of VGAM1217 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1218 (VGAM1218) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43635] VGAM1218 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1218 was detected is described hereinabove with reference to Figs. 1-8.

[43636] VGAM1218 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1218 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[43637] VGAM1218 gene encodes a VGAM1218 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1218 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1218 precursor RNA is designated SEQ ID:1204, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1204 is located at position 161690 relative to the genome of Fowlpox Virus.

[43638] VGAM1218 precursor RNA folds onto itself, forming VGAM1218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43639] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1218 folded precursor RNA into VGAM1218

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1218 RNA is designated SEQ ID:3929, and is provided hereinbelow with reference to the sequence listing part.

[43640] VGAM1218 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1218 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43641] VGAM1218 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1218 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1218 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43642] The complementary binding of VGAM1218 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1218 host target RNA into VGAM1218 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[43643] It is appreciated that VGAM1218 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1218 host target genes. The mRNA of each one of this plurality of VGAM1218 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1218 RNA, herein designated VGAM RNA, and which when bound by VGAM1218 RNA causes inhibition of translation of respective one or more VGAM1218 host target proteins.

[43644] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1218 gene, herein designated VGAM GENE, on one or more VGAM1218 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43645] It is yet further appreciated that a function of VGAM1218 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1218 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1218 correlate with, and may be deduced from, the identity of the host target genes which VGAM1218 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43646] Nucleotide sequences of the VGAM1218 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1218 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1218 are further described hereinbelow with reference to Table 1.

[43647] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1218 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1218 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43648] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1218 gene, herein designated VGAM is inhibition of expression of VGAM1218 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1218 correlate with, and may be deduced from, the identity of the target genes which VGAM1218 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43649] LOC124976 (Accession XM_058879) is a VGAM1218 host target gene. LOC124976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124976 BINDING SITE, designated SEQ ID:36780, to the nucleotide sequence of VGAM1218 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3929.

[43650] A function of VGAM1218 is therefore inhibition of LOC124976 (Accession XM_058879). Accordingly, utilities of VGAM1218 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124976. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1219 (VGAM1219) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43651] VGAM1219 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1219 was detected is described hereinabove with reference to Figs. 1–8.

[43652] VGAM1219 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1219 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43653] VGAM1219 gene encodes a VGAM1219 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1219 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1219 precursor RNA is designated SEQ ID:1205, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1205 is located at position 157189 relative to the genome of Fowlpox Virus.

- [43654] VGAM1219 precursor RNA folds onto itself, forming VGAM1219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43655] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1219 folded precursor RNA into VGAM1219 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1219 RNA is designated SEQ ID:3930, and is provided hereinbelow with reference to the sequence listing part.

[43656] VGAM1219 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1219 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43657] VGAM1219 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1219 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1219 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43658] The complementary binding of VGAM1219 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1219 host target RNA into VGAM1219 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43659] It is appreciated that VGAM1219 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1219 host target genes. The mRNA of

each one of this plurality of VGAM1219 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1219 RNA, herein designated VGAM RNA, and which when bound by VGAM1219 RNA causes inhibition of translation of respective one or more VGAM1219 host target proteins.

[43660] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1219 gene, herein designated VGAM GENE, on one or more VGAM1219 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[43661] It is yet further appreciated that a function of VGAM1219 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1219 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1219 correlate with, and may be deduced from, the identity of the host target genes which VGAM1219 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43662] Nucleotide sequences of the VGAM1219 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1219 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1219 are further described hereinbelow with reference to Table 1.

[43663] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1219 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1219 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43664] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1219 gene, herein designated VGAM is inhibition of expression of VGAM1219 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1219 correlate with, and may be deduced from, the identity of the target genes which VGAM1219 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43665] COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470) is a VGAM1219 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:27791, to the nucleotide sequence of VGAM1219 RNA, herein designated VGAM RNA, also designated SEQ ID:3930.

[43666] A function of VGAM1219 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast)

(COX15, Accession NM_078470). Accordingly, utilities of VGAM1219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Cytochrome P450, Subfamily XXXIX (oxysterol 7 alpha-hydroxylase), Polypeptide 1 (CYP39A1, Accession NM_016593) is another VGAM1219 host target gene. CYP39A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP39A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP39A1 BINDING SITE, designated SEQ ID:18681, to the nucleotide sequence of VGAM1219 RNA, herein designated VGAM RNA, also designated SEQ ID:3930.

[43667] Another function of VGAM1219 is therefore inhibition of Cytochrome P450, Subfamily XXXIX (oxysterol 7 alpha-hydroxylase), Polypeptide 1 (CYP39A1, Accession NM_016593). Accordingly, utilities of VGAM1219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP39A1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred

to here as Viral Genomic Address Messenger 1220 (VGAM1220) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43668] VGAM1220 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1220 was detected is described hereinabove with reference to Figs. 1–8.

[43669] VGAM1220 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl Adenovirus D. VGAM1220 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43670] VGAM1220 gene encodes a VGAM1220 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1220 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1220 precursor RNA is designated SEQ ID:1206, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1206 is located at position 28289 relative to the genome of Fowl Adenovirus D.

[43671] VGAM1220 precursor RNA folds onto itself, forming VGAM1220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43672] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1220 folded precursor RNA into VGAM1220 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM1220 RNA is designated SEQ ID:3931, and is provided hereinbelow with reference to the sequence listing part.

[43673] VGAM1220 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1220 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1220 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43674] VGAM1220 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1220 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1220 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43675] The complementary binding of VGAM1220 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1220 host target RNA into VGAM1220 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43676] It is appreciated that VGAM1220 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1220 host target genes. The mRNA of each one of this plurality of VGAM1220 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1220 RNA, herein designated VGAM RNA, and which when bound by VGAM1220 RNA causes inhibition of translation of respective one or more VGAM1220 host target proteins.

[43677] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1220 gene, herein designated VGAM GENE, on one or more VGAM1220 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43678] It is yet further appreciated that a function of VGAM1220 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of viral infection by Fowl Adenovirus D. Specific functions, and accordingly utilities, of VGAM1220 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1220 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43679] Nucleotide sequences of the VGAM1220 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1220 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1220 are further described hereinbelow with reference to Table 1.

[43680] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1220 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1220 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43681] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1220 gene, herein designated VGAM is inhibition of expression of VGAM1220 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1220 correlate with, and may be deduced from, the identity of the target genes which VGAM1220

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43682] Chromosome 1 Open Reading Frame 1 (C1orf1, Accession NM_001213) is a VGAM1220 host target gene. C1orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf1 BINDING SITE, designated SEQ ID:6873, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43683] A function of VGAM1220 is therefore inhibition of Chromosome 1 Open Reading Frame 1 (C1orf1, Accession NM_001213). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf1. Cyclic Nucleotide Gated Channel Alpha 3 (CNGA3, Accession NM_001298) is another VGAM1220 host target gene. CNGA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNGA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of CNGA3 BINDING SITE, designated SEQ ID:6978, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43684] Another function of VGAM1220 is therefore inhibition of Cyclic Nucleotide Gated Channel Alpha 3 (CNGA3, Accession NM_001298). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNGA3. Cut-like 1, CCAAT Displacement Protein (Drosophila) (CUTL1, Accession NM_001913) is another VGAM1220 host target gene. CUTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUTL1 BINDING SITE, designated SEQ ID:7629, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43685] Another function of VGAM1220 is therefore inhibition of Cut-like 1, CCAAT Displacement Protein (Drosophila) (CUTL1, Accession NM_001913), a gene which may regulate gene expression, morphogenesis, and differentiation.

Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUTL1. The function of CUTL1 has been established by previous studies. The activity of CDP, CCAAT displacement protein, was first identified in sea urchin as a possible repressor of a sperm-specific histone H2b gene. As implied by its name, CDP is thought to act by preventing binding of positively-acting CCAAT factors to promoters, although there is little experimental evidence for this (Neufeld, 1995). The wide distribution of CDP in mammalian cell lines and its postulated mechanism of action made it a potential candidate for a general repressor of developmentally regulated genes. Neufeld et al. (1992) purified CDP from HeLa cells by DNA binding-site affinity chromatography. The cDNA encoding CDP was obtained by immunoscreening a lambda-gt11 library with antibody raised against purified protein. The deduced primary amino acid sequence of CDP showed remarkable homology to the *Drosophila* homeoprotein cut with respect to the presence of a unique homeodomain and 'cut repeats.' As cut participates in determination of cell fate in several tissues in *Drosophila*, the similarity predicts a broad role for CDP in mammalian development. Neufeld et

al. (1992) studied CDP because of its likely role in regulation of the gene encoding the protein deficient in X-linked chronic granulomatous disease (OMIM Ref. No. 306400). Zeng et al. (1997) identified polymorphic markers within and directly adjacent to CUTL1 at 7q22 and demonstrated that these markers are present in a commonly deleted region in 7 of 50 uterine leiomyomas examined. Furthermore, Northern blot analysis revealed that CUTL1 mRNA levels were reduced in 8 of 13 tumors. Zeng et al. (1997) concluded that CUTL1 may act as a tumor suppressor gene whose inactivation could be of pathologic importance in the etiology of uterine leiomyomas.

[43686] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43687] Neufeld, E. J.; Skalnik, D. G.; Lievens, P. M.-J.; Orkin, S. H. : Human CCAAT displacement protein is homologous to the *Drosophila* homeoprotein, cut. *Nature Genet.* 1: 50-55, 1992. ; and

[43688] Snyder, S. R.; Wang, J.; Waring, J. F.; Ginder, G. D. : Identification of CCAAT displacement protein (CDP/cut) as a locus-specific repressor of major histocompatibility complex gene expr.

[43689] Further studies establishing the function and utilities of CUTL1 are found in John Hopkins OMIM database record ID 116896, and in cited publications numbered 4094–4099 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Integrin, Alpha 5 (fibronectin receptor, alpha polypeptide) (ITGA5, Accession XM_028642) is another VGAM1220 host target gene. ITGA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA5 BINDING SITE, designated SEQ ID:30723, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43690] Another function of VGAM1220 is therefore inhibition of Integrin, Alpha 5 (fibronectin receptor, alpha polypeptide) (ITGA5, Accession XM_028642), a gene which is receptor for fibronectin and fibrinogen and recognizes the sequence r–g–d in its ligands. Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA5.

The function of ITGA5 has been established by previous studies. The fibronectin receptor, a member of the integrin family of heterodimeric glycopeptides, mediates the binding of cells to fibronectin substrata. To study the structure of the receptor, Argraves et al. (1986) isolated cDNA clones coding for the alpha subunit from a placental cDNA library. The cDNAs code for 229 amino acids from the C-terminus of the alpha subunit. The deduced sequence had a hydrophobic region with properties characteristic of a membrane-spanning domain. Argraves et al. (1987) deduced the amino acid sequence from cDNA. The alpha subunit, which is processed into 2 polypeptides disulfide-bonded to one another, has 1,008 amino acids; the beta subunit has 778 amino acids. Fitzgerald et al. (1987) presented comparisons of the cDNA-derived protein sequences of fibronectin receptor, vitronectin receptor (OMIM Ref. No. 193210), and platelet glycoprotein IIb (OMIM Ref. No. 273800). Sosnoski et al. (1988) assigned the FNRA gene to 12q11-q13 by Southern analysis of somatic cell hybrid DNA. Location on chromosome 12 was confirmed by Spurr and Rooke (1991) by study of human/rodent somatic cell hybrids. Krissansen et al. (1992) pointed out the possible significance of the fact that a re-

lated gene coding for integrin beta-7 subunit (ITGB7; 147559) is also located on chromosome 12. Adkison et al. (1994) mapped the murine homolog, Itga5, to chromosome 15, distal to D15Mit16, by analysis of DNA from an interspecific backcross

[43691] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43692] Adkison, L. R.; White, R. A.; Haney, D. M.; Lee, J. C.; Pusey, K. T.; Gardner, J. : The fibronectin receptor, alpha subunit (Itga5) maps to murine chromosome 15, distal to D15Mit16. Mammalian Genome 5: 456-457, 1994. ; and

[43693] Argraves, W. S.; Pytela, R.; Suzuki, S.; Millan, J. L.; Pierschbacher, M. D.; Ruoslahti, E. : cDNA sequences from the alpha subunit of the fibronectin receptor predict a trans-membrane d.

[43694] Further studies establishing the function and utilities of ITGA5 are found in John Hopkins OMIM database record ID 135620, and in cited publications numbered 3333-3339 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nucleosome Assembly Protein 1-like 4 (NAP1L4, Accession NM_005969) is another VGAM1220 host target

gene. NAP1L4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAP1L4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAP1L4 BINDING SITE, designated SEQ ID:12590, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43695] Another function of VGAM1220 is therefore inhibition of Nucleosome Assembly Protein 1-like 4 (NAP1L4, Accession NM_005969), a gene which may have a role as a histone chaperone. Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L4. The function of NAP1L4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949. Thrombomodulin (THBD, Accession NM_000361) is another VGAM1220 host target gene. THBD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THBD, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBD BINDING SITE, designated SEQ ID:5919, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43696] Another function of VGAM1220 is therefore inhibition of Thrombomodulin (THBD, Accession NM_000361). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBD. IMPACT (Accession NM_018439) is another VGAM1220 host target gene. IMPACT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPACT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPACT BINDING SITE, designated SEQ ID:20500, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43697] Another function of VGAM1220 is therefore inhibition of IMPACT (Accession NM_018439). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IM-

PACT. KIAA0193 (Accession NM_014766) is another VGAM1220 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16544, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43698] Another function of VGAM1220 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA0476 (Accession NM_014856) is another VGAM1220 host target gene. KIAA0476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0476 BINDING SITE, designated SEQ ID:16905, to the nucleotide sequence of VGAM1220 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3931.

[43699] Another function of VGAM1220 is therefore inhibition of KIAA0476 (Accession NM_014856). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0476. KIAA1337 (Accession XM_052561) is another VGAM1220 host target gene. KIAA1337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1337 BINDING SITE, designated SEQ ID:35984, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43700] Another function of VGAM1220 is therefore inhibition of KIAA1337 (Accession XM_052561). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1337. MGC4415 (Accession NM_031484) is another VGAM1220 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4415, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25569, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43701] Another function of VGAM1220 is therefore inhibition of MGC4415 (Accession NM_031484). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. PI4KII (Accession NM_018425) is another VGAM1220 host target gene. PI4KII BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PI4KII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PI4KII BINDING SITE, designated SEQ ID:20481, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43702] Another function of VGAM1220 is therefore inhibition of PI4KII (Accession NM_018425). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PI4KII. Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215) is another VGAM1220 host target gene. TGOLN2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TGOLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGOLN2 BINDING SITE, designated SEQ ID:32025, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43703] Another function of VGAM1220 is therefore inhibition of Trans-golgi Network Protein 2 (TGOLN2, Accession XM_034215). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGOLN2. LOC126353 (Accession XM_059034) is another VGAM1220 host target gene. LOC126353 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC126353 BINDING SITE, designated SEQ ID:36828, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43704] Another function of VGAM1220 is therefore inhibition of LOC126353 (Accession XM_059034). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126353. LOC151475 (Accession XM_098063) is another VGAM1220 host target gene. LOC151475 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:41353, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43705] Another function of VGAM1220 is therefore inhibition of LOC151475 (Accession XM_098063). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475. LOC197423 (Accession XM_085436) is an-

other VGAM1220 host target gene. LOC197423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197423 BINDING SITE, designated SEQ ID:38143, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43706] Another function of VGAM1220 is therefore inhibition of LOC197423 (Accession XM_085436). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197423. LOC200138 (Accession XM_117194) is another VGAM1220 host target gene. LOC200138 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200138 BINDING SITE, designated SEQ ID:43279, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43707] Another function of VGAM1220 is therefore inhibition of LOC200138 (Accession XM_117194). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200138. LOC220753 (Accession XM_167549) is another VGAM1220 host target gene. LOC220753 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220753 BINDING SITE, designated SEQ ID:44663, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43708] Another function of VGAM1220 is therefore inhibition of LOC220753 (Accession XM_167549). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220753. LOC254559 (Accession XM_172931) is another VGAM1220 host target gene. LOC254559 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254559, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254559 BINDING SITE, designated SEQ ID:46195, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43709] Another function of VGAM1220 is therefore inhibition of LOC254559 (Accession XM_172931). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254559. LOC57795 (Accession XM_045110) is another VGAM1220 host target gene. LOC57795 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC57795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57795 BINDING SITE, designated SEQ ID:34358, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43710] Another function of VGAM1220 is therefore inhibition of LOC57795 (Accession XM_045110). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC57795. LOC90120 (Accession XM_029168) is another VGAM1220 host target gene. LOC90120 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90120 BINDING SITE, designated SEQ ID:30853, to the nucleotide sequence of VGAM1220 RNA, herein designated VGAM RNA, also designated SEQ ID:3931.

[43711] Another function of VGAM1220 is therefore inhibition of LOC90120 (Accession XM_029168). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90120. LOC93613 (Accession XM_052568) is another VGAM1220 host target gene. LOC93613 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93613 BINDING SITE, designated SEQ ID:35994, to the nucleotide sequence of VGAM1220 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3931.

[43712] Another function of VGAM1220 is therefore inhibition of LOC93613 (Accession XM_052568). Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93613. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1221 (VGAM1221) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43713] VGAM1221 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1221 was detected is described hereinabove with reference to Figs. 1–8.

[43714] VGAM1221 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl Adenovirus D. VGAM1221 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43715] VGAM1221 gene encodes a VGAM1221 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1221 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1221 precursor RNA is designated SEQ ID:1207, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1207 is located at position 26938 relative to the genome of Fowl Adenovirus D.

- [43716] VGAM1221 precursor RNA folds onto itself, forming VGAM1221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [43717] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1221 folded precursor RNA into VGAM1221 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1221 RNA is designated SEQ ID:3932, and is provided hereinbelow with reference to the sequence listing part.

[43718] VGAM1221 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1221 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43719] VGAM1221 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1221 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1221 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43720] The complementary binding of VGAM1221 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1221 host target RNA into VGAM1221 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43721] It is appreciated that VGAM1221 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1221 host target genes. The mRNA of

each one of this plurality of VGAM1221 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1221 RNA, herein designated VGAM RNA, and which when bound by VGAM1221 RNA causes inhibition of translation of respective one or more VGAM1221 host target proteins.

[43722] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1221 gene, herein designated VGAM GENE, on one or more VGAM1221 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[43723] It is yet further appreciated that a function of VGAM1221 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of viral infection by Fowl Adenovirus D. Specific functions, and accordingly utilities, of VGAM1221 correlate with, and may be deduced from, the identity of the host target genes which VGAM1221 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43724] Nucleotide sequences of the VGAM1221 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1221 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1221 are further described hereinbelow with reference to Table 1.

[43725] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1221 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1221 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43726] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1221 gene, herein designated VGAM is inhibition of expression of VGAM1221 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1221 correlate with, and may be deduced from, the identity of the target genes which VGAM1221 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43727] Diptheria Toxin Resistance Protein Required For Dipthamide Biosynthesis-like 2 (*S. cerevisiae*) (DPH2L2, Accession NM_001384) is a VGAM1221 host target gene. DPH2L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPH2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPH2L2 BINDING SITE, designated SEQ ID:7059, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43728] A function of VGAM1221 is therefore inhibition of Dipthe-

ria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 2 (*S. cerevisiae*) (DPH2L2, Accession NM_001384), a gene which is required for diphthamide biosynthesis. Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPH2L2. The function of DPH2L2 has been established by previous studies. Diphtheria toxin inhibits eukaryotic protein synthesis by ADP-ribosylating diphthamide, a posttranslationally modified histidine residue present in EF2 (OMIM Ref. No. 130610)(Foley et al., 1995). Mattheakis et al. (1993) found that *dph2*, a *S. cerevisiae* diphtheria resistance gene, encodes a protein involved in diphthamide biosynthesis. By searching an EST database, Schultz et al. (1998) identified a human cDNA with 63% identity to the corresponding nucleotide sequence of human DPH2-like 1 (DPH2L1/OVCA1; 603527). Using a PCR strategy, they recovered cDNAs corresponding to the entire coding region of the gene, which they called DPH2L2. The predicted 489-amino acid protein shared 24% and 28% sequence identity with DPH2L1 and yeast *dph2*, respectively. Northern blot analysis revealed that DPH2L2 was expressed ubiquitously as a 2.5-kb mRNA. An additional 3-kb tran-

script was found in several tissues. By fluorescence in situ hybridization, Schultz et al. (1998) mapped the DPH2L2 gene to 1p34.

[43729] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43730] Foley, B. T.; Moehring, J. M.; Moehring, T. J. : Mutations in the elongation factor 2 gene which confer resistance to diphtheria toxin and Pseudomonas exotoxin A: genetic and biochemical analyses. J. Biol. Chem. 270: 23218–23225, 1995. ; and

[43731] Schultz, D. C.; Balasara, B. R.; Testa, J. R.; Godwin, A. K. : Cloning and localization of a human diphthamide biosynthesis-like protein-2 gene, DPH2L2. Genomics 52: 186–191, 1998.

[43732] Further studies establishing the function and utilities of DPH2L2 are found in John Hopkins OMIM database record ID 603456, and in cited publications numbered 5983–5985 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_101395) is another VGAM1221 host target gene. DYRK1A BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DYRK1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:28166, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43733] Another function of VGAM1221 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_101395), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42. Interleukin 2 Receptor, Beta (IL2RB, Accession NM_000878) is another VGAM1221 host target gene. IL2RB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL2RB, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RB BINDING SITE, designated SEQ ID:6568, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43734] Another function of VGAM1221 is therefore inhibition of Interleukin 2 Receptor, Beta (IL2RB, Accession NM_000878), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RB. The function of IL2RB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM450. Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM_004896) is another VGAM1221 host target gene. VPS26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS26 BINDING SITE, designated SEQ ID:11324, to the nucleotide se-

quence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43735] Another function of VGAM1221 is therefore inhibition of Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM_004896), a gene which is a sorting protein– ensures the proper delivery of organelle–specific proteins. Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS26. The function of VPS26 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. Cystatin F (leukocystatin) (CST7, Accession NM_003650) is another VGAM1221 host target gene. CST7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CST7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CST7 BINDING SITE, designated SEQ ID:9725, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43736] Another function of VGAM1221 is therefore inhibition of

Cystatin F (leukocystatin) (CST7, Accession NM_003650). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CST7. Forkhead Box D4 (FOXD4, Accession XM_095746) is another VGAM1221 host target gene. FOXD4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOXD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD4 BINDING SITE, designated SEQ ID:40281, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43737] Another function of VGAM1221 is therefore inhibition of Forkhead Box D4 (FOXD4, Accession XM_095746). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXD4. KIAA0427 (Accession NM_014772) is another VGAM1221 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16570, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43738] Another function of VGAM1221 is therefore inhibition of KIAA0427 (Accession NM_014772). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. KIAA0794 (Accession XM_087353) is another VGAM1221 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39182, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43739] Another function of VGAM1221 is therefore inhibition of KIAA0794 (Accession XM_087353). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0794. KIAA0820 (Accession XM_044463) is another VGAM1221 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34216, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43740] Another function of VGAM1221 is therefore inhibition of KIAA0820 (Accession XM_044463). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. KIAA1024 (Accession XM_044580) is another VGAM1221 host target gene. KIAA1024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1024 BINDING SITE, designated SEQ ID:34233, to the

nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43741] Another function of VGAM1221 is therefore inhibition of KIAA1024 (Accession XM_044580). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1024. KIAA1265 (Accession XM_047707) is another VGAM1221 host target gene. KIAA1265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1265 BINDING SITE, designated SEQ ID:35030, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43742] Another function of VGAM1221 is therefore inhibition of KIAA1265 (Accession XM_047707). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1265. MGC2487 (Accession NM_023932) is another VGAM1221 host target gene. MGC2487 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by MGC2487, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2487 BINDING SITE, designated SEQ ID:23422, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43743] Another function of VGAM1221 is therefore inhibition of MGC2487 (Accession NM_023932). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2487. Mitochondrial Ribosomal Protein S11 (MRPS11, Accession NM_022839) is another VGAM1221 host target gene. MRPS11 BINDING SITE1 and MRPS11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MRPS11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS11 BINDING SITE1 and MRPS11 BINDING SITE2, designated SEQ ID:23126 and SEQ ID:45376 respectively, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43744] Another function of VGAM1221 is therefore inhibition of Mitochondrial Ribosomal Protein S11 (MRPS11, Accession NM_022839). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS11. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_020550) is another VGAM1221 host target gene. TCL6 BINDING SITE1 through TCL6 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 through TCL6 BINDING SITE4, designated SEQ ID:21758, SEQ ID:21766, SEQ ID:14841 and SEQ ID:15764 respectively, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43745] Another function of VGAM1221 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_020550). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC152674 (Accession XM_098251) is another VGAM1221 host target

gene. LOC152674 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152674 BINDING SITE, designated SEQ ID:41537, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43746] Another function of VGAM1221 is therefore inhibition of LOC152674 (Accession XM_098251). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152674. LOC163782 (Accession XM_089138) is another VGAM1221 host target gene. LOC163782 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC163782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163782 BINDING SITE, designated SEQ ID:39966, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43747] Another function of VGAM1221 is therefore inhibition of LOC163782 (Accession XM_089138). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163782. LOC56965 (Accession NM_020214) is another VGAM1221 host target gene. LOC56965 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56965 BINDING SITE, designated SEQ ID:21456, to the nucleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, also designated SEQ ID:3932.

[43748] Another function of VGAM1221 is therefore inhibition of LOC56965 (Accession NM_020214). Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56965. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1222 (VGAM1222) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[43749] VGAM1222 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1222 was detected is described hereinabove with reference to Figs. 1-8.

[43750] VGAM1222 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl Adenovirus D. VGAM1222 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43751] VGAM1222 gene encodes a VGAM1222 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1222 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1222 precursor RNA is designated SEQ ID:1208, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1208 is located at position 25411 relative to the genome of Fowl Adenovirus D.

[43752] VGAM1222 precursor RNA folds onto itself, forming VGAM1222 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43753] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1222 folded precursor RNA into VGAM1222 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1222 RNA is designated SEQ ID:3933, and is provided hereinbelow with reference to the sequence listing part.

[43754] VGAM1222 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1222 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43755] VGAM1222 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1222 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1222 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43756] The complementary binding of VGAM1222 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1222 host target RNA into VGAM1222 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43757] It is appreciated that VGAM1222 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1222 host target genes. The mRNA of each one of this plurality of VGAM1222 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1222 RNA, herein designated VGAM RNA, and which when bound by VGAM1222 RNA causes inhibition of translation of respective one or more VGAM1222 host target proteins.

[43758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1222 gene, herein designated VGAM GENE, on one or more VGAM1222 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43759] It is yet further appreciated that a function of VGAM1222 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1222 include diagnosis, prevention and treatment of viral infection by Fowl Adenovirus D. Specific functions, and accordingly utilities, of VGAM1222 correlate with, and may be deduced from, the identity of the host target genes which VGAM1222 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[43760] Nucleotide sequences of the VGAM1222 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1222 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1222 are further described hereinbelow with reference to Table 1.

[43761] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1222 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1222 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43762] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1222 gene, herein designated VGAM is inhibition of expression of VGAM1222 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1222 correlate with, and may be deduced from, the identity of the target genes which VGAM1222 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43763] RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM_002879) is a VGAM1222 host target gene. RAD52 BINDING SITE1 through RAD52 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE1 through RAD52 BINDING SITE4, designated SEQ ID:8790, SEQ ID:28647, SEQ ID:28655 and SEQ ID:28664 respectively, to the nucleotide sequence of VGAM1222 RNA, herein designated VGAM RNA, also designated SEQ ID:3933.

[43764] A function of VGAM1222 is therefore inhibition of RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM_002879). Accordingly, utilities of VGAM1222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. KIAA0286 (Accession XM_043118) is another VGAM1222 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:33907, to the nucleotide sequence of VGAM1222 RNA, herein designated VGAM RNA, also designated SEQ ID:3933.

[43765] Another function of VGAM1222 is therefore inhibition of KIAA0286 (Accession XM_043118). Accordingly, utilities of VGAM1222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. Lysyl Oxidase-like 4 (LOXL4, Accession NM_032211) is another VGAM1222 host target gene. LOXL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOXL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOXL4 BINDING SITE, designated SEQ ID:25929, to the nucleotide sequence of VGAM1222 RNA, herein designated VGAM RNA, also designated SEQ ID:3933.

[43766] Another function of VGAM1222 is therefore inhibition of Lysyl Oxidase-like 4 (LOXL4, Accession NM_032211). Accordingly, utilities of VGAM1222 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with LOXL4. LOC201696 (Accession XM_032269) is another VGAM1222 host target gene. LOC201696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201696 BINDING SITE, designated SEQ ID:31622, to the nucleotide sequence of VGAM1222 RNA, herein designated VGAM RNA, also designated SEQ ID:3933.

[43767] Another function of VGAM1222 is therefore inhibition of LOC201696 (Accession XM_032269). Accordingly, utilities of VGAM1222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1223 (VGAM1223) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43768] VGAM1223 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1223 was detected is described hereinabove with reference to Figs. 1–8.

[43769] VGAM1223 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1223 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43770] VGAM1223 gene encodes a VGAM1223 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1223 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1223 precursor RNA is designated SEQ ID:1209, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1209 is located at position 143093 relative to the genome of Equine Herpesvirus 2.

[43771] VGAM1223 precursor RNA folds onto itself, forming VGAM1223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43772] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1223 folded precursor RNA into VGAM1223 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1223 RNA is designated SEQ ID:3934, and is provided hereinbelow with reference to the sequence listing part.

[43773] VGAM1223 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1223 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[43774] VGAM1223 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1223 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1223 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43775] The complementary binding of VGAM1223 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1223 host target RNA into VGAM1223 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43776] It is appreciated that VGAM1223 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1223 host target genes. The mRNA of each one of this plurality of VGAM1223 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1223 RNA, herein designated VGAM RNA, and which when bound by VGAM1223 RNA causes inhibition of translation of respective one or more VGAM1223 host target proteins.

[43777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1223 gene, herein designated VGAM GENE, on one or more VGAM1223 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43778] It is yet further appreciated that a function of VGAM1223 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1223 correlate with, and may be deduced from, the identity of the host target genes which VGAM1223 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43779] Nucleotide sequences of the VGAM1223 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1223 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1223 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1223 are further
described hereinbelow with reference to Table 1.

[43780] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1223 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1223 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[43781] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1223 gene, herein designated VGAM is
inhibition of expression of VGAM1223 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1223 correlate with, and may be deduced
from, the identity of the target genes which VGAM1223
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[43782] UDP-GlcNAc:betaGal Beta-
1,3-N-acetylglucosaminyltransferase 3 (B3GNT3, Acces-

sion NM_014256) is a VGAM1223 host target gene.

B3GNT3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B3GNT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT3 BINDING SITE, designated SEQ ID:15531, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43783] A function of VGAM1223 is therefore inhibition of UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 3 (B3GNT3, Accession NM_014256). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT3. CERD4 (Accession NM_012074) is another VGAM1223 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14348, to the nucleotide sequence of

VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43784] Another function of VGAM1223 is therefore inhibition of CERD4 (Accession NM_012074). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. Cryptochrome 2 (photolyase-like) (CRY2, Accession XM_051030) is another VGAM1223 host target gene. CRY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRY2 BINDING SITE, designated SEQ ID:35730, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43785] Another function of VGAM1223 is therefore inhibition of Cryptochrome 2 (photolyase-like) (CRY2, Accession XM_051030), a gene which has a role in circadian photoreception in mammals. Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRY2. The function of CRY2 has been established by previous

studies. Hsu et al. (1996) identified a human gene, CRY2, whose product had 73% amino acid identity to the human (6-4)photolyase (CRY1; 601933). The CRY2 protein shares 51% amino acid sequence identity to *Drosophila* (6-4)photolyase. Hsu et al. (1996) purified the human CRY1 and CRY2 proteins and characterized them as maltose-binding fusion proteins that contain FAD and a pterin cofactor. Both CRY1 and CRY2 proteins lacked photolyase activity. Hsu et al. (1996) concluded that these proteins are not photolyases, but may function as blue-light photoreceptors in humans. As part of a search for human brain cDNA clones with the potential to encode large proteins in vitro, Ishikawa et al. (1998) independently identified CRY2. The CRY2 open reading frame encodes a protein of 589 amino acids with an apparent molecular mass of 67 kD. Animal model experiments lend further support to the function of CRY2. Yagita et al. (2001) used wildtype and *Cry1* $-/-$ and *Cry2* $-/-$ deficient cell lines derived from *Cry* mutant mice to demonstrate that the peripheral oscillator in cultured fibroblasts is identical to the oscillator in the suprachiasmatic nucleus in (1) temporal expression profiles of all known clock genes; (2) the phase of the various mRNA rhythms (i.e.,

antiphase oscillation of Bmal1 (OMIM Ref. No. 602550) and Per); (3) the delay between maximum mRNA levels and appearance of nuclear Per1 and Per2 protein; (4) the inability to produce oscillations in the absence of functional Cry genes; and (5) the control of period length by Cry proteins

[43786] It is appreciated that the abovementioned animal model for CRY2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[43787] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43788] Hsu, D. S.; Zhao, X.; Zhao, S.; Kazantsev, A.; Wang, R.-P.; Todo, T.; Wei, Y.-F.; Sancar, A. : Putative human blue-light photoreceptors hCRY1 and hCRY2 are flavoproteins. Biochemistry 35: 13871–13877, 1996. ; and

[43789] Yagita, K.; Tamanini, F.; van der Horst, G. T. J.; Okamura, H. : Molecular mechanisms of the biological clock in cultured fibroblasts. Science 292: 278–281, 2001.

[43790] Further studies establishing the function and utilities of CRY2 are found in John Hopkins OMIM database record ID 603732, and in cited publications numbered 6258–6260,

9440–6264, 1256, 584 and 6266–6267 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nucleoporin 98kDa (NUP98, Accession NM_016320) is another VGAM1223 host target gene. NUP98 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUP98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP98 BINDING SITE, designated SEQ ID:18439, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43791] Another function of VGAM1223 is therefore inhibition of Nucleoporin 98kDa (NUP98, Accession NM_016320), a gene which functions in the nuclear transport of protein and RNA. Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP98. The function of NUP98 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Chromosome 20 Open Reading Frame 103

(C20orf103, Accession NM_012261) is another VGAM1223 host target gene. C20orf103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf103 BINDING SITE, designated SEQ ID:14568, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43792] Another function of VGAM1223 is therefore inhibition of Chromosome 20 Open Reading Frame 103 (C20orf103, Accession NM_012261). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf103. CAMP-GEFII (Accession NM_007023) is another VGAM1223 host target gene. CAMP-GEFII BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMP-GEFII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMP-GEFII BINDING SITE, designated SEQ ID:13879, to

the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43793] Another function of VGAM1223 is therefore inhibition of CAMP-GEFII (Accession NM_007023). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMP-GEFII. Fidgetin (FIGN, Accession XM_171005) is another VGAM1223 host target gene. FIGN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FIGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FIGN BINDING SITE, designated SEQ ID:45775, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43794] Another function of VGAM1223 is therefore inhibition of Fidgetin (FIGN, Accession XM_171005). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIGN. FLJ10044 (Accession NM_017980) is another VGAM1223 host target gene. FLJ10044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ10044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10044 BINDING SITE, designated SEQ ID:19709, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43795] Another function of VGAM1223 is therefore inhibition of FLJ10044 (Accession NM_017980). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10044. FLJ22283 (Accession NM_032220) is another VGAM1223 host target gene. FLJ22283 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22283 BINDING SITE, designated SEQ ID:25946, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43796] Another function of VGAM1223 is therefore inhibition of FLJ22283 (Accession NM_032220). Accordingly, utilities of

VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22283. KIAA0939 (Accession XM_030524) is another VGAM1223 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31056, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43797] Another function of VGAM1223 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA1111 (Accession XM_171233) is another VGAM1223 host target gene. KIAA1111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1111 BINDING SITE, designated SEQ ID:46017, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43798] Another function of VGAM1223 is therefore inhibition of KIAA1111 (Accession XM_171233). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1111. Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM_130843) is another VGAM1223 host target gene. PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2, designated SEQ ID:28373 and SEQ ID:28368 respectively, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43799] Another function of VGAM1223 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM_130843). Accordingly, util-

ities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN2. LOC146880 (Accession XM_085627) is another VGAM1223 host target gene. LOC146880 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146880 BINDING SITE, designated SEQ ID:38256, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43800] Another function of VGAM1223 is therefore inhibition of LOC146880 (Accession XM_085627). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146880. LOC151507 (Accession XM_087225) is another VGAM1223 host target gene. LOC151507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151507 BINDING SITE, designated SEQ ID:39125, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43801] Another function of VGAM1223 is therefore inhibition of LOC151507 (Accession XM_087225). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151507. LOC168576 (Accession XM_095191) is another VGAM1223 host target gene. LOC168576 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC168576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168576 BINDING SITE, designated SEQ ID:40254, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43802] Another function of VGAM1223 is therefore inhibition of LOC168576 (Accession XM_095191). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168576. LOC196955 (Accession XM_085210) is another VGAM1223 host target gene. LOC196955 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37935, to the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, also designated SEQ ID:3934.

[43803] Another function of VGAM1223 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1224 (VGAM1224) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43804] VGAM1224 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1224 was detected is described hereinabove with reference to Figs. 1-8.

[43805] VGAM1224 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1224 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43806] VGAM1224 gene encodes a VGAM1224 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1224 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1224 precursor RNA is designated SEQ ID:1210, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1210 is located at position 141418 relative to the genome of Equine Herpesvirus 2.

[43807] VGAM1224 precursor RNA folds onto itself, forming VGAM1224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[43808] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1224 folded precursor RNA into VGAM1224 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1224 RNA is designated SEQ ID:3935, and is provided hereinbelow with reference to the sequence listing part.

[43809] VGAM1224 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1224 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1224 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43810] VGAM1224 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1224 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1224 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1224 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1224 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43811] The complementary binding of VGAM1224 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1224 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1224 host target RNA into VGAM1224 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43812] It is appreciated that VGAM1224 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1224 host target genes. The mRNA of each one of this plurality of VGAM1224 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1224 RNA, herein designated VGAM RNA, and which when bound by VGAM1224 RNA causes inhibition of translation of respective one or more VGAM1224 host target proteins.

[43813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1224 gene, herein designated VGAM GENE, on one or more VGAM1224 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43814] It is yet further appreciated that a function of VGAM1224 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1224 correlate with, and may be deduced from, the identity of the host target genes which VGAM1224 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43815] Nucleotide sequences of the VGAM1224 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1224 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1224 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1224 are further described hereinbelow with reference to Table 1.

[43816] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1224 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1224 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43817] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1224 gene, herein designated VGAM is inhibition of expression of VGAM1224 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1224 correlate with, and may be deduced from, the identity of the target genes which VGAM1224 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43818] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974) is a VGAM1224 host target gene. AKAP13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:43181, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43819] A function of VGAM1224 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17. BCL2-like 2 (BCL2L2, Accession NM_004050) is another VGAM1224 host target gene. BCL2L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L2 BINDING SITE, designated SEQ ID:10260, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ

ID:3935.

[43820] Another function of VGAM1224 is therefore inhibition of BCL2-like 2 (BCL2L2, Accession NM_004050), a gene which promotes cell survival. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L2. The function of BCL2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM431.CD244 (Accession NM_016382) is another VGAM1224 host target gene. CD244 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD244 BINDING SITE, designated SEQ ID:18525, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43821] Another function of VGAM1224 is therefore inhibition of CD244 (Accession NM_016382), a gene which can interfere with a step as proximal as phosphorylation of an activation receptor. Accordingly, utilities of VGAM1224 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with CD244. The function of CD244 has been established by previous studies. By screening a genomic DNA library and probing with mouse 2b4, followed by screening a human NK-cell cDNA library, Boles et al. (1999) isolated a cDNA encoding human 2B4. Sequence analysis predicted that the 365-amino acid protein, which is 70% similar to the mouse sequence and approximately 45% similar to other members of the CD2 family, has an 18-amino acid leader sequence; an extracellular region of 204 amino acids with 2 Ig-like motifs and 8 potential N-linked glycosylation sites; a 24-amino acid transmembrane domain; and a 120-amino acid cytoplasmic tail with 6 tyrosine residues. Northern blot analysis detected 3- and 5-kb transcripts in T- and NK-cell lines; however, peripheral blood leukocytes, spleen, and lymph node expressed only the 3-kb transcript. Southern blot analysis determined that the 2B4 gene spans approximately 25 kb. Functional analysis demonstrated that engagement of 2B4 with specific antibody activates NK cytolytic activity. By studying NK-cell function in patients with X-linked lymphoproliferative disease (XLPD; 308240) and a defect in the SAP gene, Parolini et al. (2000) found

that a number of triggering receptors displayed normal function. However, upon 2B4 interaction with CD48, NK-cell function against Epstein Barr virus (EBV)-infected cells, which is primarily mediated via NKp46 (LY94; 604530), was inhibited. Disruption of 2B4-CD48 and/or NK receptor-HLA interaction restored NK cytolytic activity. RT-PCR analysis detected the full-length 2B4 cDNA as well as a 2B4 molecule lacking the Ig C2 domain in both patients and normal individuals. Molecular analysis failed to reveal any differences between normal and patient 2B4 sequences. Immunoblot analysis showed that treatment of normal but not XLPD NK cells with pervanadate led to the association of 2B4 with SAP. Parolini et al. (2000) suggested that anti-2B4 treatment might be of use in XLPD patients awaiting bone marrow transplantation.

[43822] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43823] Parolini, S.; Bottino, C.; Falco, M.; Augugliaro, R.; Giliani, S.; Franceschini, R.; Ochs, H. D.; Wolf, H.; Bonnefoy, J.-Y.; Biassoni, R.; Moretta, L.; Notarangelo, L. D.; Moretta, A. : X-linked lymphoproliferative disease: 2B4 molecules displaying inhibitory rather than activating function are re-

sponsible for the inability of natural killer cells to kill Epstein-Barr virus-infected cells. J. Exp. Med. 192: 337-346, 2000. ; and

[43824] Boles, K. S.; Nakajima, H.; Colonna, M.; Chuang, S. S.; Stepp, S. E.; Bennett, M.; Kumar, V.; Mathew, P. A. : Molecular characterization of a novel human natural killer cell receptor ho.

[43825] Further studies establishing the function and utilities of CD244 are found in John Hopkins OMIM database record ID 605554, and in cited publications numbered 8597, 972, 4213, 877 and 973 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CDC5 Cell Division Cycle 5-like (*S. pombe*) (CDC5L, Accession NM_001253) is another VGAM1224 host target gene. CDC5L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDC5L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC5L BINDING SITE, designated SEQ ID:6923, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43826] Another function of VGAM1224 is therefore inhibition of CDC5 Cell Division Cycle 5-like (*S. pombe*) (CDC5L, Accession NM_001253). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC5L. Dachshund Homolog (*Drosophila*) (DACH, Accession NM_080759) is another VGAM1224 host target gene. DACH BINDING SITE1 and DACH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DACH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE1 and DACH BINDING SITE2, designated SEQ ID:28037 and SEQ ID:28041 respectively, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43827] Another function of VGAM1224 is therefore inhibition of Dachshund Homolog (*Drosophila*) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM260. Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM_001418) is another VGAM1224 host target gene. EIF4G2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EIF4G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4G2 BINDING SITE, designated SEQ ID:7116, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43828] Another function of VGAM1224 is therefore inhibition of Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM_001418), a gene which is a repressor of translation. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4G2. The function of EIF4G2 and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM1065. Engulfment and Cell Motility 1 (ced-12 homolog, *C. elegans*) (ELMO1, Accession NM_130442) is another VGAM1224 host target gene. ELMO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELMO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELMO1 BINDING SITE, designated SEQ ID:28205, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43829] Another function of VGAM1224 is therefore inhibition of Engulfment and Cell Motility 1 (ced-12 homolog, *C. elegans*) (ELMO1, Accession NM_130442). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELMO1. FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801) is another VGAM1224 host target gene. FKBP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKBP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FKBP1A BINDING SITE, designated SEQ ID:6476, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43830] Another function of VGAM1224 is therefore inhibition of FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801), a gene which FK506-binding protein 1A. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP1A. The function of FKBP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.GDNF Family Receptor Alpha 2 (GFRA2, Accession NM_001495) is another VGAM1224 host target gene. GFRA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFRA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFRA2 BINDING SITE, designated SEQ ID:7242, to the nucleotide sequence of VGAM1224 RNA, herein designated

VGAM RNA, also designated SEQ ID:3935.

[43831] Another function of VGAM1224 is therefore inhibition of GDNF Family Receptor Alpha 2 (GFRA2, Accession NM_001495), a gene which mediates the nrtn-induced autophosphorylation and activation of the ret receptor. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFRA2. The function of GFRA2 has been established by previous studies. Glial cell line-derived neurotrophic factor (GDNF; 600837) is a potent survival factor for central dopaminergic neurons, motor neurons, and several other populations of neurons in the central and peripheral nervous systems. The GDNF signal is mediated by a complex of the receptor tyrosine kinase RET (OMIM Ref. No. 164761) and a glycosylphosphatidylinositol (GPI)-linked protein, GDNF receptor-alpha (GDNFRA; 601496). Suvanto et al. (1997) cloned the human and rat cDNA sequences of GDNFR-beta, a gene encoding a 464-amino acid homolog of GDNFR-alpha. By fluorescence in situ hybridization, they assigned the GDNFRB gene to 8p22-p21. In addition, the mouse Gdnfrb gene was assigned to 14D3-E1. Similarly to GDNFR-alpha, GDNFR-beta mediates GDNF-induced RET autophospho-

rylation in transfected cells. By Northern hybridization, Suvanto et al. (1997) showed that the transcript level of human GDNFR-beta mRNA is high in the adult brain, intestine, and placenta, and in fetal brain, lung, and kidney. By in situ hybridization, they demonstrated that GDNFRB mRNA shows in the rat embryo a different distribution to that of GDNFRA mRNA, especially in adrenal gland, kidney, and gut. In the developing nervous system, GDNFRB mRNA expression was restricted to certain neuronal populations, while GDNFRA mRNA was widely expressed also in nonneuronal cells. Distinct tissue distribution of GDNFRB mRNA and its ability to mediate GDNF signal in transfected cells suggested a role in signal transduction of GDNF and, possibly, related neurotrophic factors in vivo. Baloh et al. (1997) independently described the cloning and initial characterization of a second coreceptor for both neurturin (NRTN; 602018) and GDNF signaling. To name the receptors appropriately for their ability to function in both GDNF and NRTN signaling, the authors referred to them as TGF-beta-related neurotrophic factor receptors 1 and 2 (TrnR1 and TmR2), where TmR1 corresponds to GDNFR-alpha. By fluorescence in situ hybridization, they mapped the gene to 8p21-p12; 8p21 is a

consensus assignment. See also the reports by Klein et al. (1997) and Sanicola et al. (1997). Various nomenclature systems have been used to describe this gene.

[43832] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43833] Baloh, R. H.; Tansey, M. G.; Golden, J. P.; Creedon, D. J.; Heuckeroth, R. O.; Keck, C. L.; Zimonjic, D. B.; Popescu, N. C.; Johnson, E. M., Jr.; Milbrandt, J. : TrnR2, a novel receptor that mediates neurturin and GDNF signaling through Ret. Neuron 18: 793–802, 1997. ; and

[43834] Klein, R. D.; Sherman, D.; Ho, W.-H.; Stone, D.; Bennett, G. L.; Moffat, B.; Vandlen, R.; Simmons, L.; Gu, Q.; Hongo, J.-A.; Devaux, B.; Poulsen, K.; Armanini, M.; Nozaki, C.; Asai, N.;

[43835] Further studies establishing the function and utilities of GFRA2 are found in John Hopkins OMIM database record ID 601956, and in cited publications numbered 634 and 5816–5818 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM_000843) is another VGAM1224 host target gene. GRM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM6 BINDING SITE, designated SEQ ID:6510, to the nucleotide sequence of VGAM1224 RNA, herein

designated VGAM RNA, also designated SEQ ID:3935.

[43836] Another function of VGAM1224 is therefore inhibition of Glutamate Receptor, Metabotropic 6 (GRM6, Accession NM_000843). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM6. Immunoglobulin Mu Binding Protein 2 (IGHMBP2, Accession NM_002180) is another VGAM1224 host target gene. IGHMBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGHMBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGHMBP2 BINDING SITE, designated SEQ ID:7938, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43837] Another function of VGAM1224 is therefore inhibition of Immunoglobulin Mu Binding Protein 2 (IGHMBP2, Accession NM_002180). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGHMBP2. LFG (Accession XM_084780) is another VGAM1224 host target gene. LFG BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37697, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43838] Another function of VGAM1224 is therefore inhibition of LFG (Accession XM_084780). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. LIM Domain Only 1 (rhombotin 1) (LMO1, Accession NM_002315) is another VGAM1224 host target gene. LMO1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LMO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO1 BINDING SITE, designated SEQ ID:8129, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43839] Another function of VGAM1224 is therefore inhibition of LIM Domain Only 1 (rhombotin 1) (LMO1, Accession

NM_002315). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO1. Phosphogluconate Dehydrogenase (PGD, Accession XM_086151) is another VGAM1224 host target gene. PGD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PGD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGD BINDING SITE, designated SEQ ID:38524, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43840] Another function of VGAM1224 is therefore inhibition of Phosphogluconate Dehydrogenase (PGD, Accession XM_086151), a gene which catalyzes a step in the pentose phosphate pathway, oxidates glucose-6-phosphate into 6-phosphoglucono-lactone. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGD. The function of PGD has been established by previous studies. Brewer and Dern (1964) reported deficiency of 6-phosphogluconate dehydrogenase (6PGD), the second

dehydrogenase in the pentose phosphate shunt, in 10 members of 4 generations of an American black family. They concluded that the inheritance is autosomal dominant, all 6PGD-deficient persons observed being heterozygotes. However, no male-to-male transmission was observed; indeed, no offspring of affected males were tested. Against X-linkage is the fact that the average enzyme level in 3 6PGD-deficient males was somewhat higher than that in seven 6PGD-deficient females. The opposite would be expected of an X-linked trait. The authors commented on the autosomal control of an enzyme that is closely related metabolically to G6PD, an enzyme determined by an X-linked gene. In a survey of unrelated persons, Dern et al. (1966) found in 3 of 873 American blacks and 2 of 275 Caucasians a reduction in erythrocyte 6-phosphogluconate dehydrogenase to the range of 42 to 65% of normal. Leukocyte enzyme was also reduced. No correlation was found between electrophoretic phenotype and the quantitative variation. The inheritance was clearly autosomal dominant. Using starch-gel electrophoresis, Fildes and Parr (1963) detected 2 distinct types of human red cell 6-phosphogluconate dehydrogenase. Ten of 150 random blood samples showed 2 broad, less distinct

bands in contrast to the single narrow, sharp band in the remainder. Inheritance appears to be autosomal, a point of particular note. Since the G6PD locus is X-linked, these 2 functionally related genes do not show clustering. Heterozygotes and homozygotes showed no quantitative difference in red blood cell 6PGD activity. Deficiency of this enzyme, with or without electrophoretic abnormality, has been observed (Parr, 1966). Nevo (1989) identified a rare PGD variant called PGD Mediterranean. Severe deficiency of 6PGD, although well-documented (Brewer and Dern, 1964; Dern et al., 1966; Parr and Fitch, 1967), has never been incriminated as the cause of hemolytic anemia. In fact, persons with less than 5% of normal activity in red cell enzymes, who were found in population surveys by Parr and Fitch (1967), were entirely asymptomatic. Beutler et al. (1985) found hemolysis in a subject in whom partial deficiency of 6PGD coexisted with G6PD deficiency, whereas no hemolysis was found in persons with the G6PD variant alone. A synergism of the 2 enzymopathies is possible

[43841] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43842] Beutler, E.; Kuhl, W.; Gelbart, T. :

6-Phosphogluconolactonase deficiency, a hereditary erythrocyte enzyme deficiency: possible interaction with glucose-6-phosphate dehydrogenase deficiency. Proc. Nat. Acad. Sci. 82: 3876-3878, 1985. ; and

[43843] Nevo, S. : A new rare PGD variant, PGD Mediterranean.

Hum. Genet. 81: 199 only, 1989.

[43844] Further studies establishing the function and utilities of

PGD are found in John Hopkins OMIM database record ID 172200, and in cited publications numbered 2104,

2105-2108, 557, 2109-2116, 346 and 3780-2122 listed

in the bibliography section hereinbelow, which are also

hereby incorporated by reference. Paired Mesoderm

Homeo Box 1 (PMX1, Accession NM_022716) is another

VGAM1224 host target gene. PMX1 BINDING SITE1 and

PMX1 BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by PMX1,

corresponding to HOST TARGET binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide se-

quences of PMX1 BINDING SITE1 and PMX1 BINDING SITE2,

designated SEQ ID:22918 and SEQ ID:13783 respectively,

to the nucleotide sequence of VGAM1224 RNA, herein

designated VGAM RNA, also designated SEQ ID:3935.

[43845] Another function of VGAM1224 is therefore inhibition of Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_022716), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1. The function of PMX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381. Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_080591) is another VGAM1224 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:27899 and SEQ ID:12129 respectively, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43846] Another function of VGAM1224 is therefore inhibition of Prostaglandin–endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_080591), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 has been established by previous studies. Prostaglandin H2 synthase is known to pharmacologists (Vane et al., 1994) as cyclooxygenase (COX), and its 2 isoforms are known as COX1 and COX2. Vane et al. (1994) outlined the actions of the 2 isoforms of COX. Stemming from this outline was a hypothesis that the therapeutic effects of drugs such as aspirin are due to inhibition of COX2, whereas the unwanted side-effects (and the action on platelets) result from inhibition of COX1. Prostaglandin–endoperoxide synthase (PTGS; EC 1.14.99.1; fatty acid cyclooxygenase; PGH synthase) is the key enzyme in prostaglandin biosynthesis. The cyclooxygenase activity of the enzyme is inhibited by nonsteroidal antiinflammatory drugs such as aspirin and endomethacin. Animal model experiments lend further sup-

port to the function of PTGS1. To study the separate roles of the 2 isoforms of cyclooxygenase, Langenbach et al. (1995) used homologous recombination to disrupt the mouse *Ptgs1* gene encoding COX1. Homozygous *Ptgs1* mutant mice survived well, had no gastric pathology, and showed less indomethacin-induced gastric ulceration than wildtype mice, even though their gastric prostaglandin E2 levels were about 1% of wildtype. Homozygous mutant mice had reduced platelet aggregation and a decreased inflammatory response to arachidonic acid, but not to tetradecanoyl phorbol acetate. *Ptgs1* homozygous mutant females mated to homozygous mutant males produced few live offspring. Langenbach et al. (1995) stated that COX1-deficient mice provided a useful model for distinguishing the physiologic roles of the 2 cyclooxygenases, COX1 and COX2.

[43847] It is appreciated that the abovementioned animal model for PTGS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[43848] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [43849] Vane, J. R.; Mitchell, J. A.; Appleton, I.; Tomlinson, A.; Bishop-Bailey, D.; Croxtall, J.; Willoughby, D. A. : Inducible isoforms of cyclooxygenase and nitric-oxide synthase in inflammation. *Proc. Nat. Acad. Sci.* 91: 2046–2050, 1994. ; and
- [43850] Langenbach, R.; Morham, S. G.; Tiano, H. F.; Loftin, C. D.; Ghanayem, B. I.; Chulada, P. C.; Mahler, J. F.; Lee, C. A.; Goulding, E. H.; Kluckman, K. D.; Kim, H. S.; Smithies, O. : *Proc.*
- [43851] Further studies establishing the function and utilities of PTGS1 are found in John Hopkins OMIM database record ID 176805, and in cited publications numbered 10845–1085 and 10887–10889 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Requiem, Apoptosis Response Zinc Finger Gene (REQ, Accession NM_006268) is another VGAM1224 host target gene. REQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by REQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REQ BINDING SITE, designated SEQ ID:12950, to the nucleotide sequence of VGAM1224

RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43852] Another function of VGAM1224 is therefore inhibition of Requiem, Apoptosis Response Zinc Finger Gene (REQ, Accession NM_006268), a gene which is a putative zinc finger that is required for apoptosis in murine myeloid cell lines. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REQ. The function of REQ has been established by previous studies. Chestkov et al. (1996) described a conserved human gene homologous to neuro-d4 (OMIM Ref. No. 601670) which they designated ubi-d4. They mapped the gene to 11q13 by fluorescence in situ hybridization. The human protein is the apparent homolog of the mouse ubi-d4 or requiem protein (Gabig et al., 1994). Expression of ubi-d4/requiem appears to be required for apoptosis (Chestkov et al., 1996; Gabig et al., 1994). Apoptosis in murine myeloid cell lines requires the expression of the Requiem gene, which encodes a putative zinc finger protein. A large consortium (Gabig et al., 1998) consisting of 3 groups detected the protein in both cytoplasmic and nuclear subcellular fractions of murine myeloid cells and human K562 leukemia cells, which sug-

gested that the protein may have a function distinct from that of a transcription factor. The distribution did not alter upon apoptosis induction by IL3 deprivation. They showed, further, that the gene was expressed in various tissues in early gestational ages; however, expression was confined to testes, spleen, thymus, and part of the hippocampus in the adult mouse. The expression profile was considered consistent with a functional role during rapid growth and cell turnover, and again suggested a regulatory function for hematopoietic cells. The nucleotide sequence of the human cDNA was 73% identical overall to that of the murine cDNA. The human sequence encodes a 391-amino acid protein. By cohybridization fluorescence in situ hybridization on extended DNA fibers, the REQ gene was localized between MLK3 (OMIM Ref. No. 600050) and FAU (OMIM Ref. No. 134690), which had been mapped to 11q13, telomeric to PYGM (OMIM Ref. No. 232600). The physical distance between MLK3 and REQ was estimated to be 150 kb.

[43853] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43854] Gabig, T. G.; Mantel, P. L.; Rosli, R.; Crean, C. D. : Re-

quiem: a novel zinc finger gene essential for apoptosis in myeloid cells. J. Biol. Chem. 269: 29515–29519, 1994. ; and

[43856] Further studies establishing the function and utilities of REQ are found in John Hopkins OMIM database record ID 601671, and in cited publications numbered 9402–9404 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAR–related Orphan Receptor B (RORB, Accession NM_006914) is another VGAM1224 host target gene. RORB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RORB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RORB BINDING SITE, designated SEQ ID:13787, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43857] Another function of VGAM1224 is therefore inhibition of

RAR-related Orphan Receptor B (RORB, Accession NM_006914), a gene which is an orphan nuclear receptor. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORB. The function of RORB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM_001754) is another VGAM1224 host target gene. RUNX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:7496, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43858] Another function of VGAM1224 is therefore inhibition of Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM_001754). Accordingly, utilities of VGAM1224 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. Sterol-C5-desaturase (ERG3 delta-5-desaturase homolog, fungal)-like (SC5DL, Accession XM_165583) is another VGAM1224 host target gene. SC5DL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SC5DL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SC5DL BINDING SITE, designated SEQ ID:43696, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43859] Another function of VGAM1224 is therefore inhibition of Sterol-C5-desaturase (ERG3 delta-5-desaturase homolog, fungal)-like (SC5DL, Accession XM_165583). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SC5DL. Sialyltransferase 1 (beta-galactoside alpha-2,6-sialyltransferase) (SIAT1, Accession NM_003032) is another VGAM1224 host target gene. SIAT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:8974, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43860] Another function of VGAM1224 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialyltransferase) (SIAT1, Accession NM_003032), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1. The function of SIAT1 has been established by previous studies. Much interest in the role and regulation of beta-galactoside alpha-2,6-sialyltransferase (EC 2.4.99.1) in B lymphocytes stemmed from its relation to CDw75, a human leukocyte cell-surface antigen expressed in mature and activated B cells but not in B cells at earlier stages of development or in plasma cells. SiaT-1 is required for the elaboration of the CDw75 cell-surface epitope. Grundmann et al. (1990) reported the complete cDNA sequence corresponding to

the SIAT1 gene on the basis of cDNA isolated from a human placental lambda-gt10 library. By Southern analysis of somatic cell hybrids and by in situ hybridization, Wang et al. (1993) demonstrated that the SIAT1 gene is located on 3q21-q28. Comparative analysis of the human and rat sequences demonstrated precise conservation of the intron/exon boundaries throughout the coding domains. Furthermore, there was extensive interspecies sequence similarity in some of the exons that contained information only for the 5-prime leader regions.

- [43861] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [43862] Grundmann, U.; Nerlich, C.; Rein, T.; Zettlmeissl, G. : Complete cDNA sequence encoding human beta-galactoside alpha-2,6-sialyltransferase. Nucleic Acids Res. 18: 667 only, 1990. ; and
- [43863] Wang, X.; Vertino, A.; Eddy, R. L.; Byers, M. G.; Jani-Sait, S. N.; Shows, T. B.; Lau, J. T. Y. : Chromosome mapping and organization of the human beta-galactoside alpha-2,6-sialyltrans.
- [43864] Further studies establishing the function and utilities of SIAT1 are found in John Hopkins OMIM database record ID

109675, and in cited publications numbered 3697–3698 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SRY (sex determining region Y)–box 4 (SOX4, Accession NM_003107) is another VGAM1224 host target gene. SOX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9074, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43865] Another function of VGAM1224 is therefore inhibition of SRY (sex determining region Y)–box 4 (SOX4, Accession NM_003107), a gene which binds with high affinity to the t-cell enhancer motif 5'–aacaag–3' motif. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4. The function of SOX4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM409. Transducin (beta)–like 1X–linked

(TBL1X, Accession NM_005647) is another VGAM1224 host target gene. TBL1X BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBL1X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:12181, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43866] Another function of VGAM1224 is therefore inhibition of Transducin (beta)-like 1X-linked (TBL1X, Accession NM_005647), a gene which activates latent HDAC3 activity. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X. The function of TBL1X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151. TIA1 Cytotoxic Granule-associated RNA Binding Protein-like 1 (TIAL1, Accession NM_022333) is another VGAM1224 host target gene. TIAL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

TIAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAL1 BINDING SITE, designated SEQ ID:22742, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43867] Another function of VGAM1224 is therefore inhibition of TIA1 Cytotoxic Granule-associated RNA Binding Protein-like 1 (TIAL1, Accession NM_022333), a gene which possesses nucleolytic activity against cytotoxic lymphocyte target cells. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAL1. The function of TIAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM350.Rho/rac Guanine Nucleotide Exchange Factor (GEF) 2 (ARHGEF2, Accession NM_004723) is another VGAM1224 host target gene. ARHGEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ARHGEF2 BINDING SITE, designated SEQ ID:11090, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43868] Another function of VGAM1224 is therefore inhibition of Rho/rac Guanine Nucleotide Exchange Factor (GEF) 2 (ARHGEF2, Accession NM_004723). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF2. Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424) is another VGAM1224 host target gene. CECR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CECR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE, designated SEQ ID:18885, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43869] Another function of VGAM1224 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424). Accordingly, utilities of

VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1. DKFZp761K1824 (Accession NM_017597) is another VGAM1224 host target gene. DKFZp761K1824 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761K1824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1824 BINDING SITE, designated SEQ ID:19059, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43870] Another function of VGAM1224 is therefore inhibition of DKFZp761K1824 (Accession NM_017597). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1824. Eukaryotic Translation Initiation Factor 4B (EIF4B, Accession XM_071605) is another VGAM1224 host target gene. EIF4B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4B BINDING SITE, designated SEQ ID:37401, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43871] Another function of VGAM1224 is therefore inhibition of Eukaryotic Translation Initiation Factor 4B (EIF4B, Accession XM_071605). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4B. F-box Only Protein 21 (FBXO21, Accession NM_033624) is another VGAM1224 host target gene. FBXO21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO21 BINDING SITE, designated SEQ ID:27326, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43872] Another function of VGAM1224 is therefore inhibition of F-box Only Protein 21 (FBXO21, Accession NM_033624). Accordingly, utilities of VGAM1224 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with FBXO21. FLJ11715 (Accession NM_024564) is another VGAM1224 host target gene. FLJ11715 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11715 BINDING SITE, designated SEQ ID:23789, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43873] Another function of VGAM1224 is therefore inhibition of FLJ11715 (Accession NM_024564). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11715. FLJ11939 (Accession NM_024679) is another VGAM1224 host target gene. FLJ11939 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11939

BINDING SITE, designated SEQ ID:23990, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43874] Another function of VGAM1224 is therefore inhibition of FLJ11939 (Accession NM_024679). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11939. FLJ12619 (Accession NM_030939) is another VGAM1224 host target gene. FLJ12619 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12619 BINDING SITE, designated SEQ ID:25211, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43875] Another function of VGAM1224 is therefore inhibition of FLJ12619 (Accession NM_030939). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12619. FLJ12700 (Accession NM_024910) is another VGAM1224 host target gene. FLJ12700 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:24416, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43876] Another function of VGAM1224 is therefore inhibition of FLJ12700 (Accession NM_024910). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12700. FLJ20739 (Accession XM_042197) is another VGAM1224 host target gene. FLJ20739 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20739 BINDING SITE, designated SEQ ID:33704, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43877] Another function of VGAM1224 is therefore inhibition of

FLJ20739 (Accession XM_042197). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20739. FLJ21945 (Accession NM_025203) is another VGAM1224 host target gene. FLJ21945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21945 BINDING SITE, designated SEQ ID:24868, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43878] Another function of VGAM1224 is therefore inhibition of FLJ21945 (Accession NM_025203). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21945. FLJ30567 (Accession NM_145022) is another VGAM1224 host target gene. FLJ30567 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ30567 BINDING SITE, designated SEQ ID:29629, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43879] Another function of VGAM1224 is therefore inhibition of FLJ30567 (Accession NM_145022). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30567. KIAA0010 (Accession NM_014671) is another VGAM1224 host target gene. KIAA0010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0010 BINDING SITE, designated SEQ ID:16130, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43880] Another function of VGAM1224 is therefore inhibition of KIAA0010 (Accession NM_014671). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0010. KIAA0237 (Accession NM_014747) is another

VGAM1224 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16454, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43881] Another function of VGAM1224 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0426 (Accession NM_014724) is another VGAM1224 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16309, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43882] Another function of VGAM1224 is therefore inhibition of KIAA0426 (Accession NM_014724). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. KIAA0427 (Accession NM_014772) is another VGAM1224 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16573, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43883] Another function of VGAM1224 is therefore inhibition of KIAA0427 (Accession NM_014772). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. KIAA0792 (Accession NM_014698) is another VGAM1224 host target gene. KIAA0792 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0792, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0792 BINDING SITE, designated SEQ ID:16215, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43884] Another function of VGAM1224 is therefore inhibition of KIAA0792 (Accession NM_014698). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0792. KIAA1052 (Accession NM_014956) is another VGAM1224 host target gene. KIAA1052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1052 BINDING SITE, designated SEQ ID:17310, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43885] Another function of VGAM1224 is therefore inhibition of KIAA1052 (Accession NM_014956). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1052. KIAA1205 (Accession XM_046305) is another VGAM1224 host target gene. KIAA1205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1205 BINDING SITE, designated SEQ ID:34705, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43886] Another function of VGAM1224 is therefore inhibition of KIAA1205 (Accession XM_046305). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1205. KIAA1322 (Accession XM_052626) is another VGAM1224 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36021, to the nucleotide sequence of VGAM1224 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3935.

[43887] Another function of VGAM1224 is therefore inhibition of KIAA1322 (Accession XM_052626). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1467 (Accession XM_049605) is another VGAM1224 host target gene. KIAA1467 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1467, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1467 BINDING SITE, designated SEQ ID:35452, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43888] Another function of VGAM1224 is therefore inhibition of KIAA1467 (Accession XM_049605). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1467. KIAA1674 (Accession XM_044065) is another VGAM1224 host target gene. KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1674, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34110, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43889] Another function of VGAM1224 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. KIAA1819 (Accession XM_045716) is another VGAM1224 host target gene. KIAA1819 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1819 BINDING SITE, designated SEQ ID:34536, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43890] Another function of VGAM1224 is therefore inhibition of KIAA1819 (Accession XM_045716). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1819. KIAA1918 (Accession XM_054951) is another VGAM1224 host target gene. KIAA1918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:36218, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43891] Another function of VGAM1224 is therefore inhibition of KIAA1918 (Accession XM_054951). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1918. KIAA1949 (Accession XM_166376) is another VGAM1224 host target gene. KIAA1949 BINDING SITE1 through KIAA1949 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1949, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1949 BINDING SITE1 through

KIAA1949 BINDING SITE3, designated SEQ ID:44209, SEQ ID:46668 and SEQ ID:46713 respectively, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43892] Another function of VGAM1224 is therefore inhibition of KIAA1949 (Accession XM_166376). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1949. MGC16491 (Accession NM_052943) is another VGAM1224 host target gene. MGC16491 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC16491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16491 BINDING SITE, designated SEQ ID:27502, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43893] Another function of VGAM1224 is therefore inhibition of MGC16491 (Accession NM_052943). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16491. Myosin XVIIIIB (MYO18B, Accession

NM_032608) is another VGAM1224 host target gene.

MYO18B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO18B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO18B BINDING SITE, designated SEQ ID:26332, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43894] Another function of VGAM1224 is therefore inhibition of Myosin XVIIIIB (MYO18B, Accession NM_032608). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO18B. Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_144498) is another VGAM1224 host target gene. OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2, desig-

nated SEQ ID:29319 and SEQ ID:16851 respectively, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43895] Another function of VGAM1224 is therefore inhibition of Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_144498). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2. Phosphatase, Orphan 1 (phospho1, Accession XM_091572) is another VGAM1224 host target gene. phospho1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by phospho1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phospho1 BINDING SITE, designated SEQ ID:40062, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43896] Another function of VGAM1224 is therefore inhibition of Phosphatase, Orphan 1 (phospho1, Accession XM_091572). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phospho1. SDS3 (Accession

XM_045014) is another VGAM1224 host target gene. SDS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDS3 BINDING SITE, designated SEQ ID:34319, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43897] Another function of VGAM1224 is therefore inhibition of SDS3 (Accession XM_045014). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDS3. SIMRP7 (Accession XM_166462) is another VGAM1224 host target gene. SIMRP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIMRP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated SEQ ID:44373, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43898] Another function of VGAM1224 is therefore inhibition of SIMRP7 (Accession XM_166462). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7. SP192 (Accession NM_021639) is another VGAM1224 host target gene. SP192 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SP192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP192 BINDING SITE, designated SEQ ID:22299, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43899] Another function of VGAM1224 is therefore inhibition of SP192 (Accession NM_021639). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP192. Stathmin-like 3 (STMN3, Accession NM_015894) is another VGAM1224 host target gene. STMN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STMN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STMN3 BINDING SITE, designated SEQ ID:18039, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43900] Another function of VGAM1224 is therefore inhibition of Stathmin-like 3 (STMN3, Accession NM_015894). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STMN3. LOC126917 (Accession XM_059091) is another VGAM1224 host target gene. LOC126917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE, designated SEQ ID:36868, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43901] Another function of VGAM1224 is therefore inhibition of LOC126917 (Accession XM_059091). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC126917. LOC144114 (Accession XM_090198) is another VGAM1224 host target gene. LOC144114 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144114 BINDING SITE, designated SEQ ID:39995, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43902] Another function of VGAM1224 is therefore inhibition of LOC144114 (Accession XM_090198). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144114. LOC144473 (Accession XM_096606) is another VGAM1224 host target gene. LOC144473 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144473 BINDING SITE, designated SEQ ID:40415, to the nucleotide sequence of VGAM1224 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3935.

[43903] Another function of VGAM1224 is therefore inhibition of LOC144473 (Accession XM_096606). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144473. LOC144866 (Accession XM_096699) is another VGAM1224 host target gene. LOC144866 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144866 BINDING SITE, designated SEQ ID:40478, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43904] Another function of VGAM1224 is therefore inhibition of LOC144866 (Accession XM_096699). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144866. LOC145815 (Accession XM_096874) is another VGAM1224 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145815, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145815 BINDING SITE, designated SEQ ID:40603, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43905] Another function of VGAM1224 is therefore inhibition of LOC145815 (Accession XM_096874). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. LOC146823 (Accession XM_097105) is another VGAM1224 host target gene. LOC146823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146823 BINDING SITE, designated SEQ ID:40750, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43906] Another function of VGAM1224 is therefore inhibition of LOC146823 (Accession XM_097105). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC146823. LOC153146 (Accession XM_098319) is another VGAM1224 host target gene. LOC153146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153146 BINDING SITE, designated SEQ ID:41577, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43907] Another function of VGAM1224 is therefore inhibition of LOC153146 (Accession XM_098319). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153146. LOC155072 (Accession XM_098661) is another VGAM1224 host target gene. LOC155072 BINDING SITE1 and LOC155072 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC155072, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155072 BINDING SITE1

and LOC155072 BINDING SITE2, designated SEQ ID:41759 and SEQ ID:41762 respectively, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43908] Another function of VGAM1224 is therefore inhibition of LOC155072 (Accession XM_098661). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155072. LOC202868 (Accession XM_117477) is another VGAM1224 host target gene. LOC202868 BINDING SITE1 and LOC202868 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC202868, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202868 BINDING SITE1 and LOC202868 BINDING SITE2, designated SEQ ID:43450 and SEQ ID:43024 respectively, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43909] Another function of VGAM1224 is therefore inhibition of LOC202868 (Accession XM_117477). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC202868. LOC221814 (Accession XM_168226) is another VGAM1224 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45097, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43910] Another function of VGAM1224 is therefore inhibition of LOC221814 (Accession XM_168226). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. LOC254532 (Accession XM_172961) is another VGAM1224 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46214, to

the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43911] Another function of VGAM1224 is therefore inhibition of LOC254532 (Accession XM_172961). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC89944 (Accession XM_166198) is another VGAM1224 host target gene. LOC89944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89944 BINDING SITE, designated SEQ ID:44004, to the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, also designated SEQ ID:3935.

[43912] Another function of VGAM1224 is therefore inhibition of LOC89944 (Accession XM_166198). Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89944. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1225 (VGAM1225) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43913] VGAM1225 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1225 was detected is described hereinabove with reference to Figs. 1–8.

[43914] VGAM1225 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 1. VGAM1225 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43915] VGAM1225 gene encodes a VGAM1225 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1225 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1225 precursor RNA is designated SEQ ID:1211, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1211 is located at position 88490 relative to the genome of Human Herpesvirus 1.

[43916] VGAM1225 precursor RNA folds onto itself, forming VGAM1225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43917] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1225 folded precursor RNA into VGAM1225 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1225 RNA is designated SEQ ID:3936, and is provided hereinbelow with reference to the sequence listing part.

[43918] VGAM1225 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1225 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1225 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43919] VGAM1225 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1225 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1225 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43920] The complementary binding of VGAM1225 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1225 host target RNA into VGAM1225 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43921] It is appreciated that VGAM1225 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1225 host target genes. The mRNA of each one of this plurality of VGAM1225 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1225 RNA, herein designated VGAM RNA, and which when bound by VGAM1225 RNA causes inhibition of translation of respective one or more VGAM1225 host target proteins.

[43922] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1225 gene, herein designated VGAM GENE, on one or more VGAM1225 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43923] It is yet further appreciated that a function of VGAM1225 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1225 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1225 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43924] Nucleotide sequences of the VGAM1225 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1225 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1225 are further described hereinbelow with reference to Table 1.

[43925] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1225 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1225 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43926] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1225 gene, herein designated VGAM is inhibition of expression of VGAM1225 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1225 correlate with, and may be deduced from, the identity of the target genes which VGAM1225

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43927] Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM_002235) is a VGAM1225 host target gene. KCNA6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA6 BINDING SITE, designated SEQ ID:8016, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43928] A function of VGAM1225 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM_002235), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA6. The function of KCNA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM893. Maltase–glucoamylase (alpha–glucosidase) (MGAM, Accession XM_051351) is another VGAM1225 host target gene. MGAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAM BINDING SITE, designated SEQ ID:35823, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43929] Another function of VGAM1225 is therefore inhibition of Maltase–glucoamylase (alpha–glucosidase) (MGAM, Accession XM_051351), a gene which plays a role in the final steps of digestion of starch. Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAM. The function of MGAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791. C16orf5 (Accession NM_013399) is another VGAM1225 host target gene. C16orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by C16orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:15056, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43930] Another function of VGAM1225 is therefore inhibition of C16orf5 (Accession NM_013399). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf5. KIAA1303 (Accession XM_038376) is another VGAM1225 host target gene. KIAA1303 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1303 BINDING SITE, designated SEQ ID:32833, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43931] Another function of VGAM1225 is therefore inhibition of KIAA1303 (Accession XM_038376). Accordingly, utilities

of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1303. NFASC (Accession XM_046808) is another VGAM1225 host target gene. NFASC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFASC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFASC BINDING SITE, designated SEQ ID:34829, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43932] Another function of VGAM1225 is therefore inhibition of NFASC (Accession XM_046808). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFASC. NIR3 (Accession XM_038799) is another VGAM1225 host target gene. NIR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIR3 BINDING SITE, designated SEQ

ID:32925, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43933] Another function of VGAM1225 is therefore inhibition of NIR3 (Accession XM_038799). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIR3. NYD-SP25 (Accession NM_033516) is another VGAM1225 host target gene. NYD-SP25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NYD-SP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP25 BINDING SITE, designated SEQ ID:27294, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43934] Another function of VGAM1225 is therefore inhibition of NYD-SP25 (Accession NM_033516). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP25. LOC132422 (Accession XM_067839) is another VGAM1225 host target gene. LOC132422 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132422 BINDING SITE, designated SEQ ID:37369, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43935] Another function of VGAM1225 is therefore inhibition of LOC132422 (Accession XM_067839). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132422. LOC143915 (Accession XM_096502) is another VGAM1225 host target gene. LOC143915 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143915 BINDING SITE, designated SEQ ID:40376, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43936] Another function of VGAM1225 is therefore inhibition of

LOC143915 (Accession XM_096502). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143915. LOC151178 (Accession XM_087117) is another VGAM1225 host target gene. LOC151178 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151178 BINDING SITE, designated SEQ ID:39070, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43937] Another function of VGAM1225 is therefore inhibition of LOC151178 (Accession XM_087117). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151178. LOC166042 (Accession XM_093623) is another VGAM1225 host target gene. LOC166042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC166042 BINDING SITE, designated SEQ ID:40197, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43938] Another function of VGAM1225 is therefore inhibition of LOC166042 (Accession XM_093623). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166042. LOC196759 (Accession XM_113601) is another VGAM1225 host target gene. LOC196759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196759 BINDING SITE, designated SEQ ID:42293, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43939] Another function of VGAM1225 is therefore inhibition of LOC196759 (Accession XM_113601). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196759. LOC197201 (Accession XM_113839) is an-

other VGAM1225 host target gene. LOC197201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:42460, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43940] Another function of VGAM1225 is therefore inhibition of LOC197201 (Accession XM_113839). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201. LOC254755 (Accession XM_173224) is another VGAM1225 host target gene. LOC254755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254755 BINDING SITE, designated SEQ ID:46486, to the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, also designated SEQ ID:3936.

[43941] Another function of VGAM1225 is therefore inhibition of LOC254755 (Accession XM_173224). Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254755. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1226 (VGAM1226) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43942] VGAM1226 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1226 was detected is described hereinabove with reference to Figs. 1–8.

[43943] VGAM1226 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tacaribe Virus.

VGAM1226 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43944] VGAM1226 gene encodes a VGAM1226 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1226 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1226 precursor RNA is designated SEQ ID:1212, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1212 is located at position 6654 relative to the genome of Tacaribe Virus.

[43945] VGAM1226 precursor RNA folds onto itself, forming VGAM1226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43946] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1226 folded precursor RNA into VGAM1226 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 64%) nucleotide sequence of VGAM1226 RNA is designated SEQ ID:3937, and is provided hereinbelow with reference to the sequence listing part.

[43947] VGAM1226 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1226 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43948] VGAM1226 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1226 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1226 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43949] The complementary binding of VGAM1226 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1226 host target RNA into VGAM1226 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43950] It is appreciated that VGAM1226 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1226 host target genes. The mRNA of each one of this plurality of VGAM1226 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1226 RNA, herein designated VGAM RNA, and which when bound by VGAM1226 RNA causes inhibition of translation of respective one or more VGAM1226 host target proteins.

[43951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1226 gene, herein designated VGAM GENE, on one or more VGAM1226 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43952] It is yet further appreciated that a function of VGAM1226 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of viral infection by Tacaribe Virus. Specific functions, and accordingly utilities, of VGAM1226 correlate with, and may be deduced from, the identity of the host target genes which VGAM1226 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43953] Nucleotide sequences of the VGAM1226 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1226 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1226 are further described hereinbelow with reference to Table 1.

[43954] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1226 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1226 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[43955] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1226 gene, herein designated VGAM is inhibition of expression of VGAM1226 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1226 correlate with, and may be deduced from, the identity of the target genes which VGAM1226 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43956] Archain 1 (ARCN1, Accession NM_001655) is a VGAM1226 host target gene. ARCN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARCN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE, designated SEQ ID:7364, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43957] A function of VGAM1226 is therefore inhibition of Archain 1 (ARCN1, Accession NM_001655), a gene which plays a fundamental role in eukaryotic cell biology. Accordingly, utilities of VGAM1226 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ARCN1. The function of ARCN1 has been established by previous studies. Radice et al. (1995) identified a gene that maps approximately 50-kb telomeric to MLL (OMIM Ref. No. 159555) in band 11q23.3, a locus disrupted in certain leukemia-associated translocation chromosomes. A 200-kb genomic fragment from a YAC that includes MLL was used to screen a cDNA library of the R54;11 cell line which carries a translocation chromosome t(4;11)(q21; q23). The cDNA sequence predicts a 511-amino acid protein which shares similarity with predicted proteins of unknown function from rice (*Oryza sativa*) and *Drosophila*. Because of this ancient conservation the authors proposed the name archain (ARCN1). Radice et al. (1995) detected 4-kb ARCN1 transcripts by Northern blot analysis in all tissues examined. The protein encoded by the ARCN1 gene, the coatomer protein delta-COP, probably plays a fundamental role in eukaryotic cell biology. Tunnacliffe et al. (1996) demonstrated that it is conserved across diverse eukaryotes. Very close or identical matches were seen in rat and cow; highly significant matches were seen with 2 plant species, *A. thaliana* (cress) and *S. tuberosum* (OMIM Ref. No. potato). Of particular bi-

ologic significance was the match with a sequence on yeast chromosome VI, from which Tunnacliffe et al. (1996) were able to determine the yeast archain gene and protein sequence. Unpublished data indicated that in situ hybridizations on mouse embryo sections showed archain transcripts throughout the whole animal.

[43958] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[43959] Radice, P.; Pensotti, V.; Jones, C.; Perry, H.; Pierotti, M. A.; Tunnacliffe, A. : The human archain gene, ARCN1, has highly conserved homologs in rice and Drosophila. *Genomics* 26: 101–106, 1995. ; and

[43960] Tunnacliffe, A.; van de Vrugt, H.; Pensotti, V.; Radice, P. : The coatomer protein delta-COP, encoded by the archain gene, is conserved across diverse eukaryotes. *Mammalian Genome* 7: 78.

[43961] Further studies establishing the function and utilities of ARCN1 are found in John Hopkins OMIM database record ID 600820, and in cited publications numbered 7529–7530 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cyclin D2 (CCND2, Accession NM_001759) is another VGAM1226

host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7510, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43962] Another function of VGAM1226 is therefore inhibition of Cyclin D2 (CCND2, Accession NM_001759), a gene which is essential for the control of the cell cycle at the G1/S (start) transition. Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. Leukemia Inhibitory Factor Receptor (LIFR, Accession NM_002310) is another VGAM1226 host target gene. LIFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIFR, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIFR BINDING SITE, designated SEQ ID:8098, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43963] Another function of VGAM1226 is therefore inhibition of Leukemia Inhibitory Factor Receptor (LIFR, Accession NM_002310). Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIFR. C-myc Binding Protein (MYCBP, Accession NM_012333) is another VGAM1226 host target gene. MYCBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYCBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCBP BINDING SITE, designated SEQ ID:14724, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43964] Another function of VGAM1226 is therefore inhibition of C-myc Binding Protein (MYCBP, Accession NM_012333), a gene which binds c-Myc stimulating the activation of E-

box-dependent transcription. Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCBP. The function of MYCBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435. Tryptophanyl-tRNA Synthetase (WARS, Accession XM_041014) is another VGAM1226 host target gene. WARS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WARS BINDING SITE, designated SEQ ID:33412, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43965] Another function of VGAM1226 is therefore inhibition of Tryptophanyl-tRNA Synthetase (WARS, Accession XM_041014), a gene which is a tryptophanyl-tRNA synthetase. Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WARS. The function of WARS and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM68.KLK15 (Accession NM_023006) is another VGAM1226 host target gene. KLK15 BINDING SITE1 and KLK15 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK15, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK15 BINDING SITE1 and KLK15 BINDING SITE2, designated SEQ ID:23262 and SEQ ID:28860 respectively, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43966] Another function of VGAM1226 is therefore inhibition of KLK15 (Accession NM_023006). Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK15. LOC132241 (Accession XM_059583) is another VGAM1226 host target gene. LOC132241 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC132241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC132241 BINDING SITE, designated SEQ ID:37022, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43967] Another function of VGAM1226 is therefore inhibition of LOC132241 (Accession XM_059583). Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132241. LOC158434 (Accession XM_098939) is another VGAM1226 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41984, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43968] Another function of VGAM1226 is therefore inhibition of LOC158434 (Accession XM_098939). Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC158549 (Accession XM_098963) is an-

other VGAM1226 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42008, to the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, also designated SEQ ID:3937.

[43969] Another function of VGAM1226 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1227 (VGAM1227) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43970] VGAM1227 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1227 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[43971] VGAM1227 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tacaribe Virus.

VGAM1227 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43972] VGAM1227 gene encodes a VGAM1227 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1227 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1227 precursor RNA is designated SEQ ID:1213, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1213 is located at position 1706 relative to the genome of Tacaribe Virus.

[43973] VGAM1227 precursor RNA folds onto itself, forming VGAM1227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43974] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1227 folded precursor RNA into VGAM1227 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1227 RNA is designated SEQ ID:3938, and is provided hereinbelow with reference to the sequence listing part.

[43975] VGAM1227 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1227 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43976] VGAM1227 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1227 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1227 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43977] The complementary binding of VGAM1227 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1227 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1227 host target RNA into VGAM1227 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43978] It is appreciated that VGAM1227 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1227 host target genes. The mRNA of each one of this plurality of VGAM1227 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1227 RNA, herein designated VGAM RNA, and which when bound by VGAM1227 RNA causes inhibition of translation of respective one or more VGAM1227 host target proteins.

[43979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1227 gene, herein designated VGAM GENE, on one or more VGAM1227 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43980] It is yet further appreciated that a function of VGAM1227 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1227 include diagnosis, prevention and treatment of viral infection by Tacaribe Virus. Specific functions, and accordingly utilities, of VGAM1227 correlate with, and may be deduced from, the identity of the host target genes which VGAM1227 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43981] Nucleotide sequences of the VGAM1227 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1227 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1227 are further described hereinbelow with reference to Table 1.

[43982] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1227 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1227 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43983] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1227 gene, herein designated VGAM is inhibition of expression of VGAM1227 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1227 correlate with, and may be deduced from, the identity of the target genes which VGAM1227 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[43984] Hexokinase 1 (HK1, Accession NM_033497) is a VGAM1227 host target gene. HK1 BINDING SITE1 through HK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HK1, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HK1 BINDING SITE1 through HK1 BINDING SITE3, designated SEQ ID:27268, SEQ ID:27274 and SEQ ID:27271 respectively, to the nucleotide sequence of VGAM1227 RNA, herein designated VGAM RNA, also designated SEQ ID:3938.

[43985] A function of VGAM1227 is therefore inhibition of Hexokinase 1 (HK1, Accession NM_033497). Accordingly, utilities of VGAM1227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HK1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1228 (VGAM1228) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[43986] VGAM1228 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1228 was detected is described hereinabove with reference to Figs. 1-8.

[43987] VGAM1228 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tacaribe Virus.

VGAM1228 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[43988] VGAM1228 gene encodes a VGAM1228 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1228 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1228 precursor RNA is designated SEQ ID:1214, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1214 is located at position 2505 relative to the genome of Tacaribe Virus.

[43989] VGAM1228 precursor RNA folds onto itself, forming VGAM1228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[43990] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1228 folded precursor RNA into VGAM1228 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1228 RNA is designated SEQ ID:3939, and is provided hereinbelow with reference to the sequence listing part.

[43991] VGAM1228 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1228 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[43992] VGAM1228 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1228 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1228 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[43993] The complementary binding of VGAM1228 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1228

host target RNA into VGAM1228 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[43994] It is appreciated that VGAM1228 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1228 host target genes. The mRNA of each one of this plurality of VGAM1228 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1228 RNA, herein designated VGAM RNA, and which when bound by VGAM1228 RNA causes inhibition of translation of respective one or more VGAM1228 host target proteins.

[43995] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1228 gene, herein designated VGAM GENE, on one or more VGAM1228 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[43996] It is yet further appreciated that a function of VGAM1228 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of viral infection by Tacaribe Virus. Specific functions, and accordingly utilities, of VGAM1228 correlate with, and may be deduced from, the identity of the host target genes which VGAM1228 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[43997] Nucleotide sequences of the VGAM1228 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1228 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1228 are further

described hereinbelow with reference to Table 1.

[43998] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1228 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1228 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[43999] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1228 gene, herein designated VGAM is inhibition of expression of VGAM1228 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1228 correlate with, and may be deduced from, the identity of the target genes which VGAM1228 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44000] Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM_001408) is a VGAM1228 host target gene. CELSR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of CELSR2 BINDING SITE, designated SEQ ID:7106, to the nucleotide sequence of VGAM1228 RNA, herein designated VGAM RNA, also designated SEQ ID:3939.

[44001] A function of VGAM1228 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM_001408), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR2. The function of CELSR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432. ERAP140 (Accession XM_059748) is another VGAM1228 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37085, to the nucleotide sequence of VGAM1228 RNA, herein designated VGAM RNA, also designated SEQ

ID:3939.

[44002] Another function of VGAM1228 is therefore inhibition of ERAP140 (Accession XM_059748). Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAP140. FLJ13910 (Accession NM_022780) is another VGAM1228 host target gene. FLJ13910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13910 BINDING SITE, designated SEQ ID:23055, to the nucleotide sequence of VGAM1228 RNA, herein designated VGAM RNA, also designated SEQ ID:3939.

[44003] Another function of VGAM1228 is therefore inhibition of FLJ13910 (Accession NM_022780). Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13910. HCA127 (Accession NM_018684) is another VGAM1228 host target gene. HCA127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA127, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA127 BINDING SITE, designated SEQ ID:20759, to the nucleotide sequence of VGAM1228 RNA, herein designated VGAM RNA, also designated SEQ ID:3939.

[44004] Another function of VGAM1228 is therefore inhibition of HCA127 (Accession NM_018684). Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA127. KIAA1009 (Accession NM_014895) is another VGAM1228 host target gene. KIAA1009 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1009 BINDING SITE, designated SEQ ID:17052, to the nucleotide sequence of VGAM1228 RNA, herein designated VGAM RNA, also designated SEQ ID:3939.

[44005] Another function of VGAM1228 is therefore inhibition of KIAA1009 (Accession NM_014895). Accordingly, utilities of VGAM1228 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1009. Kv6.3 (Accession NM_133490) is another VGAM1228 host target gene. Kv6.3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Kv6.3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Kv6.3 BINDING SITE, designated SEQ ID:28566, to the nucleotide sequence of VGAM1228 RNA, herein designated VGAM RNA, also designated SEQ ID:3939.

[44006] Another function of VGAM1228 is therefore inhibition of Kv6.3 (Accession NM_133490). Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Kv6.3. PRO0365 (Accession NM_014126) is another VGAM1228 host target gene. PRO0365 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0365, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:15389, to the nucleotide sequence of

VGAM1228 RNA, herein designated VGAM RNA, also designated SEQ ID:3939.

[44007] Another function of VGAM1228 is therefore inhibition of PRO0365 (Accession NM_014126). Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365. LOC152742 (Accession XM_098259) is another VGAM1228 host target gene. LOC152742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152742 BINDING SITE, designated SEQ ID:41544, to the nucleotide sequence of VGAM1228 RNA, herein designated VGAM RNA, also designated SEQ ID:3939.

[44008] Another function of VGAM1228 is therefore inhibition of LOC152742 (Accession XM_098259). Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152742. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1229 (VGAM1229) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44009] VGAM1229 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1229 was detected is described hereinabove with reference to Figs. 1–8.

[44010] VGAM1229 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tacaribe Virus. VGAM1229 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44011] VGAM1229 gene encodes a VGAM1229 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1229 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1229 precursor RNA is designated SEQ ID:1215, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1215 is located at position 2314 relative to the genome of Tacaribe Virus.

[44012] VGAM1229 precursor RNA folds onto itself, forming VGAM1229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44013] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1229 folded precursor RNA into VGAM1229 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1229 RNA is designated SEQ ID:3940, and is provided hereinbelow with reference to the sequence listing part.

[44014] VGAM1229 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1229 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1229 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44015] VGAM1229 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1229 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1229 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44016] The complementary binding of VGAM1229 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1229 host target RNA into VGAM1229 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44017] It is appreciated that VGAM1229 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1229 host target genes. The mRNA of each one of this plurality of VGAM1229 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1229 RNA, herein designated VGAM RNA, and which when bound by VGAM1229 RNA causes inhibition of translation of respective one or more VGAM1229 host target proteins.

[44018] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1229 gene, herein designated VGAM GENE, on one or more VGAM1229 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44019] It is yet further appreciated that a function of VGAM1229 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of viral infection by Tacaribe Virus. Specific functions, and accordingly utilities, of VGAM1229 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1229 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44020] Nucleotide sequences of the VGAM1229 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1229 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1229 are further described hereinbelow with reference to Table 1.

[44021] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1229 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1229 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44022] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1229 gene, herein designated VGAM is inhibition of expression of VGAM1229 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1229 correlate with, and may be deduced from, the identity of the target genes which VGAM1229

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44023] Cysteine-rich, Angiogenic Inducer, 61 (CYR61, Accession NM_001554) is a VGAM1229 host target gene. CYR61 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYR61, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYR61 BINDING SITE, designated SEQ ID:7276, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44024] A function of VGAM1229 is therefore inhibition of Cysteine-rich, Angiogenic Inducer, 61 (CYR61, Accession NM_001554), a gene which promotes the adhesion of endothelial cells. Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYR61. The function of CYR61 has been established by previous studies. CYR61 is a secreted, cysteine-rich, heparin-binding protein encoded by a growth factor-inducible immediate-early gene. Acting as an extracellular, matrix-associated signaling molecule, CYR61 promotes the adhesion of endothelial

cells through interaction with integrin and augments growth factor-induced DNA synthesis in the same cell type. Babic et al. (1998) showed that purified CYR61 stimulates directed migration of human microvascular endothelial cells in culture through the $\alpha(V)\beta(3)$ -dependent pathway and induces neovascularization in rat corneas. Both the chemotactic and angiogenic activities of CYR61 can be blocked by specific anti-CYR61 antibodies. Whereas most human tumor-derived cell lines tested expressed CYR61, a gastric adenocarcinoma cell line did not. Expression of the CYR61 cDNA under the regulation of a constitutive promoter from this gastric cancer cell line significantly enhanced the tumorigenicity of these cells as measured by growth in immunodeficient mice, resulting in tumors that were larger and more vascularized than those produced by control cells. Taken together, these results identified CYR61 as an angiogenic inducer that can promote tumor growth and vascularization; the results also suggested to Babic et al. (1998) potential roles for CYR61 in physiologic and pathologic neovascularization. Sampath et al. (2001) used rapid analysis of differential expression (RADE) to identify genes that are abnormally expressed in leiomyomas. Of

the several genes identified, CYR61, a member of the CCN family of growth and angiogenic regulators, was shown to be markedly downregulated at the mRNA and protein levels in leiomyoma tumors compared with the 38 matched uterine myometrial controls. In addition, in situ hybridization experiments corroborated the lack of CYR61 expression in leiomyoma cells, whereas abundant transcript levels were identified in adjacent myometrial smooth muscle cells. To elucidate the mechanisms of CYR61 gene regulation in leiomyomas, they determined the effects of ovarian steroids, basic fibroblast growth factor (FGFB; 134920), and serum on CYR61 expression using an ex vivo culture system. Treatment of human myometrial explants with 17-beta-estradiol and FGFB upregulated CYR61 transcripts. Paradoxically, neither 17-beta-estradiol nor FGFB was capable of upregulating CYR61 mRNA in leiomyoma explants despite elevated levels of ESRA (OMIM Ref. No. 133430) mRNA. The authors concluded that dysregulation of CYR61 by estrogen and FGFB may contribute to downregulation of CYR61 in leiomyomas which, in turn, may predispose uterine smooth muscle cells toward sustained growth.

[44025] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [44026] Babic, A. M.; Kireeva, M. L.; Kolesnikova, T. V.; Lau, L. F. : CYR61, a product of a growth factor-inducible immediate early gene, promotes angiogenesis and tumor growth. Proc. Nat. Acad. Sci. 95: 6355–6360, 1998. ; and
- [44027] Sampath, D.; Zhu, Y.; Winneker, R. C.; Zhang, Z. : Aberrant expression of Cyr61, a member of the CCN (CTGF/Cyr61/Cef10/NOVH) family, and dysregulation by 17-beta-estradiol and basic fibr.
- [44028] Further studies establishing the function and utilities of CYR61 are found in John Hopkins OMIM database record ID 602369, and in cited publications numbered 8934–893 and 11958–8938 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037) is another VGAM1229 host target gene. LRP4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP4 BINDING SITE, designated SEQ

ID:32195, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44029] Another function of VGAM1229 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. Nuclear Factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM_003204) is another VGAM1229 host target gene. NFE2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFE2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFE2L1 BINDING SITE, designated SEQ ID:9198, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44030] Another function of VGAM1229 is therefore inhibition of Nuclear Factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM_003204), a gene which may regulate expression of ferritin genes. Accordingly, utilities of VGAM1229

include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2L1. The function of NFE2L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM369. Tropomodulin 2 (neuronal) (TMOD2, Accession NM_014548) is another VGAM1229 host target gene. TMOD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD2 BINDING SITE, designated SEQ ID:15859, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44031] Another function of VGAM1229 is therefore inhibition of Tropomodulin 2 (neuronal) (TMOD2, Accession NM_014548), a gene which is an actin-capping protein for the slow-growing end of filamentous actin. Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD2. The function of TMOD2 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791. ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM_031949) is another VGAM1229 host target gene.

ACTR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR1A BINDING SITE, designated SEQ ID:31533, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44032] Another function of VGAM1229 is therefore inhibition of ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM_031949). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR1A. Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM_029741) is another VGAM1229 host target gene. C20orf130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by C20orf130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf130 BINDING SITE, designated SEQ ID:30934, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44033] Another function of VGAM1229 is therefore inhibition of Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM_029741). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf130. FLJ22087 (Accession NM_022070) is another VGAM1229 host target gene. FLJ22087 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22087 BINDING SITE, designated SEQ ID:22613, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44034] Another function of VGAM1229 is therefore inhibition of

FLJ22087 (Accession NM_022070). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22087. KIAA0940 (Accession NM_014912) is another VGAM1229 host target gene. KIAA0940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0940 BINDING SITE, designated SEQ ID:17148, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44035] Another function of VGAM1229 is therefore inhibition of KIAA0940 (Accession NM_014912). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0940. KIAA1463 (Accession XM_051160) is another VGAM1229 host target gene. KIAA1463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:35771, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44036] Another function of VGAM1229 is therefore inhibition of KIAA1463 (Accession XM_051160). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463. MGC2541 (Accession NM_080670) is another VGAM1229 host target gene. MGC2541 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2541 BINDING SITE, designated SEQ ID:27963, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44037] Another function of VGAM1229 is therefore inhibition of MGC2541 (Accession NM_080670). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2541. MIL1 (Accession NM_015367) is another

VGAM1229 host target gene. MIL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIL1 BINDING SITE, designated SEQ ID:17665, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44038] Another function of VGAM1229 is therefore inhibition of MIL1 (Accession NM_015367). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIL1. Mucin 17 (MUC17, Accession XM_168583) is another VGAM1229 host target gene. MUC17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MUC17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC17 BINDING SITE, designated SEQ ID:45259, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44039] Another function of VGAM1229 is therefore inhibition of Mucin 17 (MUC17, Accession XM_168583). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC17. PRO1257 (Accession NM_018578) is another VGAM1229 host target gene. PRO1257 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1257 BINDING SITE, designated SEQ ID:20656, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44040] Another function of VGAM1229 is therefore inhibition of PRO1257 (Accession NM_018578). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1257. Ring Finger Protein 2 (RNF2, Accession NM_007212) is another VGAM1229 host target gene. RNF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF2 BINDING SITE, designated SEQ ID:14074, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44041] Another function of VGAM1229 is therefore inhibition of Ring Finger Protein 2 (RNF2, Accession NM_007212). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF2. LOC164397 (Accession XM_092780) is another VGAM1229 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40147, to the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, also designated SEQ ID:3940.

[44042] Another function of VGAM1229 is therefore inhibition of LOC164397 (Accession XM_092780). Accordingly, utilities of VGAM1229 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC164397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1230 (VGAM1230) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44043] VGAM1230 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1230 was detected is described hereinabove with reference to Figs. 1–8.

[44044] VGAM1230 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1230 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44045] VGAM1230 gene encodes a VGAM1230 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1230 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1230 precursor RNA is desig-

nated SEQ ID:1216, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1216 is located at position 12219 relative to the genome of Equine Herpesvirus 2.

- [44046] VGAM1230 precursor RNA folds onto itself, forming VGAM1230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44047] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1230 folded precursor RNA into VGAM1230 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1230 RNA is designated SEQ ID:3941, and is provided hereinbelow with reference to the sequence

listing part.

[44048] VGAM1230 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1230 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44049] VGAM1230 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1230 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1230 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44050] The complementary binding of VGAM1230 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1230 host target RNA into VGAM1230 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44051] It is appreciated that VGAM1230 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1230 host target genes. The mRNA of each one of this plurality of VGAM1230 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1230 RNA, herein designated VGAM

RNA, and which when bound by VGAM1230 RNA causes inhibition of translation of respective one or more VGAM1230 host target proteins.

[44052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1230 gene, herein designated VGAM GENE, on one or more VGAM1230 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44053] It is yet further appreciated that a function of VGAM1230 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1230 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1230 correlate with, and may be deduced from, the identity of the host target genes which VGAM1230 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44054] Nucleotide sequences of the VGAM1230 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1230 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1230 are further described hereinbelow with reference to Table 1.

[44055] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1230 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1230 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44056] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1230 gene, herein designated VGAM is

inhibition of expression of VGAM1230 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1230 correlate with, and may be deduced from, the identity of the target genes which VGAM1230 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44057] Acid Phosphatase 2, Lysosomal (ACP2, Accession NM_001610) is a VGAM1230 host target gene. ACP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACP2 BINDING SITE, designated SEQ ID:7318, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44058] A function of VGAM1230 is therefore inhibition of Acid Phosphatase 2, Lysosomal (ACP2, Accession NM_001610). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP2. Agrin (AGRN, Accession XM_086178) is another VGAM1230 host target gene. AGRN BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by AGRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGRN BINDING SITE, designated SEQ ID:38536, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44059] Another function of VGAM1230 is therefore inhibition of Agrin (AGRN, Accession XM_086178), a gene which a neuronal aggregating factor that induces the aggregation of acetylcholine receptors . Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGRN. The function of AGRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1063.E2F Transcription Factor 3 (E2F3, Accession NM_001949) is another VGAM1230 host target gene. E2F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

E2F3 BINDING SITE, designated SEQ ID:7664, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44060] Another function of VGAM1230 is therefore inhibition of E2F Transcription Factor 3 (E2F3, Accession NM_001949), a gene which binds dna and controls cell-cycle progression from g1 to s phase. Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F3. The function of E2F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475.LIM Domains Containing 1 (LIMD1, Accession NM_014240) is another VGAM1230 host target gene. LIMD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMD1 BINDING SITE, designated SEQ ID:15502, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44061] Another function of VGAM1230 is therefore inhibition of LIM Domains Containing 1 (LIMD1, Accession NM_014240). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMD1. Neurocalcin Delta (NCALD, Accession NM_032041) is another VGAM1230 host target gene. NCALD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCALD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCALD BINDING SITE, designated SEQ ID:25745, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44062] Another function of VGAM1230 is therefore inhibition of Neurocalcin Delta (NCALD, Accession NM_032041). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCALD. SH3 and Multiple Ankyrin Repeat Domains 2 (SHANK2, Accession NM_012309) is another VGAM1230 host target gene. SHANK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SHANK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHANK2 BINDING SITE, designated SEQ ID:14684, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44063] Another function of VGAM1230 is therefore inhibition of SH3 and Multiple Ankyrin Repeat Domains 2 (SHANK2, Accession NM_012309). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHANK2. Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM_005069) is another VGAM1230 host target gene. SIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM2 BINDING SITE, designated SEQ ID:11516, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44064] Another function of VGAM1230 is therefore inhibition of

Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM_005069), a gene which may be a master gene of CNS development. Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM2. The function of SIM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM369. Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184) is another VGAM1230 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31303, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44065] Another function of VGAM1230 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SPON1. DKFZP564L0864 (Accession XM_051905) is another VGAM1230 host target gene. DKFZP564L0864 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564L0864, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564L0864 BINDING SITE, designated SEQ ID:35919, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44066] Another function of VGAM1230 is therefore inhibition of DKFZP564L0864 (Accession XM_051905). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564L0864. DKFZp761B1514 (Accession NM_032288) is another VGAM1230 host target gene. DKFZp761B1514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761B1514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZp761B1514 BINDING SITE, designated SEQ ID:26047, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44067] Another function of VGAM1230 is therefore inhibition of DKFZp761B1514 (Accession NM_032288). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B1514. F-box Only Protein 9 (FBXO9, Accession NM_033480) is another VGAM1230 host target gene. FBXO9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO9 BINDING SITE, designated SEQ ID:27258, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44068] Another function of VGAM1230 is therefore inhibition of F-box Only Protein 9 (FBXO9, Accession NM_033480). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with FBXO9. KDEL (Lys–Asp–Glu–Leu) Endoplasmic Reticulum Protein Retention Receptor 3 (KDEL3, Accession NM_006855) is another VGAM1230 host target gene. KDEL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KDEL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KDEL3 BINDING SITE, designated SEQ ID:13724, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44069] Another function of VGAM1230 is therefore inhibition of KDEL (Lys–Asp–Glu–Leu) Endoplasmic Reticulum Protein Retention Receptor 3 (KDEL3, Accession NM_006855). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KDEL3. KIAA0914 (Accession NM_014883) is another VGAM1230 host target gene. KIAA0914 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0914 BINDING SITE, designated SEQ ID:17034, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44070] Another function of VGAM1230 is therefore inhibition of KIAA0914 (Accession NM_014883). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0914. SKIP (Accession NM_130766) is another VGAM1230 host target gene. SKIP BINDING SITE1 and SKIP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SKIP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKIP BINDING SITE1 and SKIP BINDING SITE2, designated SEQ ID:28264 and SEQ ID:18600 respectively, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44071] Another function of VGAM1230 is therefore inhibition of SKIP (Accession NM_130766). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SKIP. LOC146856 (Accession XM_096086) is another VGAM1230 host target gene. LOC146856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146856 BINDING SITE, designated SEQ ID:40297, to the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44072] Another function of VGAM1230 is therefore inhibition of LOC146856 (Accession XM_096086). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146856. LOC200609 (Accession XM_117256) is another VGAM1230 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43321, to

the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, also designated SEQ ID:3941.

[44073] Another function of VGAM1230 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1231 (VGAM1231) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44074] VGAM1231 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1231 was detected is described hereinabove with reference to Figs. 1–8.

[44075] VGAM1231 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1231 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44076] VGAM1231 gene encodes a VGAM1231 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1231 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1231 precursor RNA is designated SEQ ID:1217, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1217 is located at position 10445 relative to the genome of Equine Herpesvirus 2.

[44077] VGAM1231 precursor RNA folds onto itself, forming VGAM1231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44078] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1231 folded precursor RNA into VGAM1231 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1231 RNA is designated SEQ ID:3942, and is provided hereinbelow with reference to the sequence listing part.

[44079] VGAM1231 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1231 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44080] VGAM1231 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1231 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1231 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44081] The complementary binding of VGAM1231 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1231 host target RNA into VGAM1231 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44082] It is appreciated that VGAM1231 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1231 host target genes. The mRNA of each one of this plurality of VGAM1231 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1231 RNA, herein designated VGAM RNA, and which when bound by VGAM1231 RNA causes inhibition of translation of respective one or more VGAM1231 host target proteins.

[44083] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1231 gene, herein designated VGAM GENE, on one or more VGAM1231 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[44084] It is yet further appreciated that a function of VGAM1231 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1231 correlate with, and may be deduced from, the identity of the host target genes which VGAM1231 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44085] Nucleotide sequences of the VGAM1231 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1231 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1231 are further described hereinbelow with reference to Table 1.

[44086] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1231 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1231 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44087] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1231 gene, herein designated VGAM is inhibition of expression of VGAM1231 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1231 correlate with, and may be deduced from, the identity of the target genes which VGAM1231 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44088] Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM_001393) is a VGAM1231 host target gene. ECM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ECM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ECM2 BINDING SITE, designated SEQ ID:7087, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44089] A function of VGAM1231 is therefore inhibition of Extra-

cellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM_001393). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ECM2. Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM1231 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22031, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44090] Another function of VGAM1231 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM95.Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM_013988) is another VGAM1231 host target gene. PARK2 BINDING SITE1 through PARK2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PARK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARK2 BINDING SITE1 through PARK2 BINDING SITE3, designated SEQ ID:15161, SEQ ID:10907 and SEQ ID:15154 respectively, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44091] Another function of VGAM1231 is therefore inhibition of Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM_013988). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARK2. DKFZP434L187 (Accession XM_044070) is another VGAM1231 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34127, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44092] Another function of VGAM1231 is therefore inhibition of DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. FLJ11004 (Accession NM_018296) is another VGAM1231 host target gene. FLJ11004 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11004 BINDING SITE, designated SEQ ID:20288, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44093] Another function of VGAM1231 is therefore inhibition of FLJ11004 (Accession NM_018296). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ11004. KIAA0495 (Accession XM_031397) is another VGAM1231 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31360, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44094] Another function of VGAM1231 is therefore inhibition of KIAA0495 (Accession XM_031397). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA1600 (Accession XM_049351) is another VGAM1231 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:35395, to the

nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44095] Another function of VGAM1231 is therefore inhibition of KIAA1600 (Accession XM_049351). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. Leptin Receptor Overlapping Transcript-like 1 (LEPROTL1, Accession NM_015344) is another VGAM1231 host target gene. LEPROTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEPROTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEPROTL1 BINDING SITE, designated SEQ ID:17649, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44096] Another function of VGAM1231 is therefore inhibition of Leptin Receptor Overlapping Transcript-like 1 (LEPROTL1, Accession NM_015344). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEPROTL1. LOC142955 (Accession XM_084389) is another

VGAM1231 host target gene. LOC142955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142955 BINDING SITE, designated SEQ ID:37570, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44097] Another function of VGAM1231 is therefore inhibition of LOC142955 (Accession XM_084389). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142955. LOC257103 (Accession XM_170982) is another VGAM1231 host target gene. LOC257103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257103 BINDING SITE, designated SEQ ID:45754, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44098] Another function of VGAM1231 is therefore inhibition of LOC257103 (Accession XM_170982). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257103. LOC90148 (Accession XM_029430) is another VGAM1231 host target gene. LOC90148 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90148 BINDING SITE, designated SEQ ID:30892, to the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, also designated SEQ ID:3942.

[44099] Another function of VGAM1231 is therefore inhibition of LOC90148 (Accession XM_029430). Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90148. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1232 (VGAM1232) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[44100] VGAM1232 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1232 was detected is described hereinabove with reference to Figs. 1–8.

[44101] VGAM1232 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1232 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44102] VGAM1232 gene encodes a VGAM1232 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1232 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1232 precursor RNA is designated SEQ ID:1218, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1218 is located at position 14553 relative to the genome of Equine Herpesvirus 2.

[44103] VGAM1232 precursor RNA folds onto itself, forming VGAM1232 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44104] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1232 folded precursor RNA into VGAM1232 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1232 RNA is designated SEQ ID:3943, and is provided hereinbelow with reference to the sequence listing part.

[44105] VGAM1232 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1232 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44106] VGAM1232 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1232 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1232 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44107] The complementary binding of VGAM1232 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1232 host target RNA into VGAM1232 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44108] It is appreciated that VGAM1232 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1232 host target genes. The mRNA of each one of this plurality of VGAM1232 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1232 RNA, herein designated VGAM RNA, and which when bound by VGAM1232 RNA causes inhibition of translation of respective one or more VGAM1232 host target proteins.

[44109] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1232 gene, herein designated VGAM GENE, on one or more VGAM1232 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44110] It is yet further appreciated that a function of VGAM1232 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1232 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1232 correlate with, and may be deduced from, the identity of the host target genes which VGAM1232 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[44111] Nucleotide sequences of the VGAM1232 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1232 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1232 are further described hereinbelow with reference to Table 1.

[44112] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1232 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1232 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44113] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1232 gene, herein designated VGAM is inhibition of expression of VGAM1232 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1232 correlate with, and may be deduced from, the identity of the target genes which VGAM1232 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44114] Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2B (GRIN2B, Accession NM_000834) is a VGAM1232 host target gene. GRIN2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GRIN2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN2B BINDING SITE, designated SEQ ID:6491, to the nucleotide sequence of VGAM1232 RNA, herein designated VGAM RNA, also designated SEQ ID:3943.

[44115] A function of VGAM1232 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2B (GRIN2B, Accession NM_000834). Accordingly, utilities of VGAM1232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN2B. LPTM5 (Accession NM_006762) is another VGAM1232 host target gene. LPTM5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPTM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPTM5

BINDING SITE, designated SEQ ID:13615, to the nucleotide sequence of VGAM1232 RNA, herein designated VGAM RNA, also designated SEQ ID:3943.

[44116] Another function of VGAM1232 is therefore inhibition of LPTM5 (Accession NM_006762). Accordingly, utilities of VGAM1232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPTM5. D15Wsu75e (Accession XM_039495) is another VGAM1232 host target gene. D15Wsu75e BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D15Wsu75e, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D15Wsu75e BINDING SITE, designated SEQ ID:33101, to the nucleotide sequence of VGAM1232 RNA, herein designated VGAM RNA, also designated SEQ ID:3943.

[44117] Another function of VGAM1232 is therefore inhibition of D15Wsu75e (Accession XM_039495). Accordingly, utilities of VGAM1232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D15Wsu75e. LOC146452 (Accession XM_085473) is another VGAM1232 host target gene. LOC146452 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146452 BINDING SITE, designated SEQ ID:38161, to the nucleotide sequence of VGAM1232 RNA, herein designated VGAM RNA, also designated SEQ ID:3943.

[44118] Another function of VGAM1232 is therefore inhibition of LOC146452 (Accession XM_085473). Accordingly, utilities of VGAM1232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146452. LOC149461 (Accession XM_086547) is another VGAM1232 host target gene. LOC149461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149461 BINDING SITE, designated SEQ ID:38761, to the nucleotide sequence of VGAM1232 RNA, herein designated VGAM RNA, also designated SEQ ID:3943.

[44119] Another function of VGAM1232 is therefore inhibition of

LOC149461 (Accession XM_086547). Accordingly, utilities of VGAM1232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149461. LOC222057 (Accession XM_166594) is another VGAM1232 host target gene. LOC222057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222057 BINDING SITE, designated SEQ ID:44573, to the nucleotide sequence of VGAM1232 RNA, herein designated VGAM RNA, also designated SEQ ID:3943.

[44120] Another function of VGAM1232 is therefore inhibition of LOC222057 (Accession XM_166594). Accordingly, utilities of VGAM1232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222057. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1233 (VGAM1233) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[44121] VGAM1233 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1233 was detected is described hereinabove with reference to Figs. 1–8.

[44122] VGAM1233 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1233 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44123] VGAM1233 gene encodes a VGAM1233 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1233 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1233 precursor RNA is designated SEQ ID:1219, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1219 is located at position 11297 relative to the genome of Equine Herpesvirus 2.

[44124] VGAM1233 precursor RNA folds onto itself, forming VGAM1233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44125] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1233 folded precursor RNA into VGAM1233 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1233 RNA is designated SEQ ID:3944, and is provided hereinbelow with reference to the sequence listing part.

[44126] VGAM1233 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1233 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[44127] VGAM1233 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1233 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1233 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[44128] The complementary binding of VGAM1233 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1233 host target RNA into VGAM1233 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44129] It is appreciated that VGAM1233 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1233 host target genes. The mRNA of each one of this plurality of VGAM1233 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1233 RNA, herein designated VGAM RNA, and which when bound by VGAM1233 RNA causes inhibition of translation of respective one or more VGAM1233 host target proteins.

[44130] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1233 gene, herein designated VGAM GENE, on one

or more VGAM1233 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44131] It is yet further appreciated that a function of VGAM1233 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1233 correlate with, and may be deduced from, the identity of the host target genes which VGAM1233 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44132] Nucleotide sequences of the VGAM1233 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1233 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1233 are further described hereinbelow with reference to Table 1.

[44133] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1233 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1233 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44134] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1233 gene, herein designated VGAM is inhibition of expression of VGAM1233 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1233 correlate with, and may be deduced from, the identity of the target genes which VGAM1233 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44135] DNA Fragmentation Factor, 40kDa, Beta Polypeptide

(caspase-activated DNase) (DFFB, Accession XM_113366) is a VGAM1233 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42238, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44136] A function of VGAM1233 is therefore inhibition of DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB. The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Deiodinase, Iodothyronine, Type III (DIO3, Accession NM_001362) is another VGAM1233 host target gene. DIO3 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by DIO3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO3 BINDING SITE, designated SEQ ID:7041, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44137] Another function of VGAM1233 is therefore inhibition of Deiodinase, Iodothyronine, Type III (DIO3, Accession NM_001362), a gene which regulates circulating fetal thyroid hormone concentrations . Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO3. The function of DIO3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM638.Ectodysplasin 1, Anhidrotic Receptor (EDAR, Accession NM_022336) is another VGAM1233 host target gene. EDAR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EDAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of EDAR BINDING SITE, designated SEQ ID:22744, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44138] Another function of VGAM1233 is therefore inhibition of Ectodysplasin 1, Anhidrotic Receptor (EDAR, Accession NM_022336). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDAR. Insulin-like Growth Factor Binding Protein 5 (IGFBP5, Accession NM_000599) is another VGAM1233 host target gene. IGFBP5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IGFBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP5 BINDING SITE, designated SEQ ID:6201, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44139] Another function of VGAM1233 is therefore inhibition of Insulin-like Growth Factor Binding Protein 5 (IGFBP5, Accession NM_000599), a gene which either inhibits or stimulates the growth promoting effects of the igfs on cell culture. Accordingly, utilities of VGAM1233 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with IGFBP5. The function of IGFBP5 has been established by previous studies. See 146733. Allander et al. (1994) cloned the IGFBP5 gene from a human genomic library and showed that it is divided into 4 exons which, primarily due to a first intron of approximately 25 kb, span about 33 kb of DNA. Southern analysis identified a single copy of the IGFBP5 gene in the haploid human genome. By PCR amplification of DNA from somatic human/rodent cell hybrids, by fluorescence in situ hybridization, and by hybridization to pulsed field gel electrophoresis fragments, they showed that the gene is located on 2q33-q34. The IGFBP2 gene (OMIM Ref. No. 146731) and the IGFBP5 gene are transcribed convergently and are separated by approximately 20 to 40 kb of DNA. Primer extension studies identified the IGFBP5 mRNA cap site 772 bp 5-prime to the first nucleotide of the translation start codon. A potential TATA element beginning 33 bp 5-prime to the mRNA cap site was identified. When a DNA fragment containing this cap site and 461 bp of upstream sequence was placed 5-prime to the chloramphenicol acetyltransferase (CAT) reporter gene and transfected into human breast cancer cells, it directed

CAT expression in an orientation-specific manner, suggesting that this region contains elements essential for IGFBP5 promoter activity. Kou et al. (1994) demonstrated that, in the mouse, Igfbp2 and Igfbp5 colocalize to a proximal region of chromosome 1 that is syntenic with human chromosome 2q33-q36 and that the 2 genes are 5 kb apart in a tail-to-tail orientation. This suggests that the human IGFBP5 gene is located on 2q33-q36. Kou et al. (1994) also used interspecific backcross mapping and gene cloning to demonstrate that the Igfbp1 and Igfbp3 are located in the proximal part of chromosome 11. In the human genome, these 2 loci map within 20 kb of one another on 7p14-p12, and the genes are organized in a tail-to-tail configuration. The results suggested to Kou et al. (1994) an evolutionary scheme in which a primordial IGFBP gene duplicated to form a cluster that was later replicated to create a second linkage group.

[44140] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44141] Allander, S. V.; Larsson, C.; Ehrenborg, E.; Suwanichkul, A.; Weber, G.; Morris, S. L.; Bajalica, S.; Kiefer, M. C.; Luthman, H.; Powell, D. R. : Characterization of the chromoso-

mal gene and promoter for human insulin-like growth factor binding protein-5. J. Biol. Chem. 269: 10891-10898, 1994. ; and

[44142] Kou, K.; James, P. L.; Clemmons, D. R.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Rotwein, P. : Identification of two clusters of mouse insulin-like growth factor binding protein.

[44143] Further studies establishing the function and utilities of IGFBP5 are found in John Hopkins OMIM database record ID 146734, and in cited publications numbered 12013 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM_003024) is another VGAM1233 host target gene. ITSN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITSN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITSN1 BINDING SITE, designated SEQ ID:8957, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44144] Another function of VGAM1233 is therefore inhibition of

Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM_003024), a gene which may be involved in endocytosis and synaptic vesicle recycling. Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITSN1. The function of ITSN1 has been established by previous studies. See 147265. Ozcelik et al. (1991) found that a cDNA probe for ITPR3 hybridized to DNA from hybrid cells containing human chromosome 6. In one hybrid that carried 6pter-p21, in the absence of an intact copy of this chromosome, hybridization was observed, thus mapping the gene to 6pter-p21. ITPR3 transduces many hormonal signals that regulate Ca^{2+} -dependent processes in the intestinal epithelium. Maranto (1994) described complete sequence of the ITPR3 polypeptide (2,671 amino acids). Primary structure analysis indicated a pattern of conserved and variable regions, characteristic of the particular gene family. Immunocytochemical localization in the intestine was determined. Yamamoto-Hino et al. (1994) likewise mapped the ITPR3 gene to chromosome 6, specifically to 6p21, by isotopic in situ hybridization. They showed that the type 3 receptor was present in all hematopoietic and lymphoma cell lines tested

- [44145] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [44146] Maranto, A. R. : Primary structure, ligand binding, and localization of the human type 3 inositol 1,4,5-trisphosphate receptor expressed in intestinal epithelium. *J. Biol. Chem.* 269: 1222–1230, 1994. ; and
- [44147] Ozcelik, T.; Suedhof, T. C.; Francke, U. : The genes for inositol 1,4,5-trisphosphate receptors 1 (ITPR1) and 3 (ITPR3) are localized on human chromosomes 3p and 6pter–p21, respectively.
- [44148] Further studies establishing the function and utilities of ITSN1 are found in John Hopkins OMIM database record ID 602442, and in cited publications numbered 5612–5613, 586 and 5868 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RNA Binding Motif Protein 3 (RBM3, Accession XM_047024) is another VGAM1233 host target gene. RBM3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RBM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM3 BIND-

ING SITE, designated SEQ ID:34892, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44149] Another function of VGAM1233 is therefore inhibition of RNA Binding Motif Protein 3 (RBM3, Accession XM_047024). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM3. Regulator of G-protein Signalling 3 (RGS3, Accession NM_017790) is another VGAM1233 host target gene. RGS3 BINDING SITE1 through RGS3 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RGS3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS3 BINDING SITE1 through RGS3 BINDING SITE6, designated SEQ ID:19422, SEQ ID:22086, SEQ ID:29307, SEQ ID:28281, SEQ ID:28667 and SEQ ID:29305 respectively, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44150] Another function of VGAM1233 is therefore inhibition of Regulator of G-protein Signalling 3 (RGS3, Accession

NM_017790), a gene which negatively regulates G protein-coupled receptor signalling. Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS3. The function of RGS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM404. Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM_006521) is another VGAM1233 host target gene. TFE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFE3 BINDING SITE, designated SEQ ID:13275, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44151] Another function of VGAM1233 is therefore inhibition of Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM_006521), a gene which is a positive-acting transcription factor that binds to the immunoglobulin enhancer μ 3 motif. Accordingly, utilities of VGAM1233

include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFE3. The function of TFE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM443. Tumor Suppressing Subtransferable Candidate 4 (TSSC4, Accession NM_005706) is another VGAM1233 host target gene. TSSC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TSSC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSSC4 BINDING SITE, designated SEQ ID:12258, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44152] Another function of VGAM1233 is therefore inhibition of Tumor Suppressing Subtransferable Candidate 4 (TSSC4, Accession NM_005706), a gene which is of unknown function. Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSSC4. The function of TSSC4 has been established by previous studies. Lee et al. (1999)

noted that 7 imprinted genes had been identified on 11p15: IGF2 (OMIM Ref. No. 147470), which encodes an important autocrine growth factor in cancer; H19 (OMIM Ref. No. 103280), an untranslated RNA whose imprinting regulates IGF2; ASCL2 (OMIM Ref. No. 601886), a homolog of *Drosophila* achaete–scute that is expressed in the trophoblast; KCNQ1 (OMIM Ref. No. 192500), which encodes a voltage–gated potassium channel; p57(KIP2) (CDKN1C; 600856), which encodes a cyclin–dependent kinase inhibitor; TSSC5 (IMPT1; 602631), which encodes a predicted transmembrane transporter; and TSSC3 (OMIM Ref. No. 602131), also known as IPL, a homolog of a mouse apoptosis–inducing gene. With the exception of IGF2, all of these genes are expressed from the maternal allele. Because of the large number of imprinted genes on 11p15, spanning approximately 1 Mb, this region appears to represent 1 of 2 known large imprinted domains in the human genome, the other being the Prader–Willi/Angelman syndrome domain of 15q11–q13 (see OMIM Ref. No. 105830). Koi et al. (1993) isolated a sub–chromosomal transferable fragment (STF) that suppresses in vitro growth of the rhabdomyosarcoma cell line RD, confirming the existence of 1 or more tumor suppressor

genes within this region. Hu et al. (1997) found that the STF spans approximately 2.5 Mb, with D11S12 at its proximal end and D11S1318 at its distal end. Within a cluster of imprinted genes in this STF, Lee et al. (1999) identified 2 novel genes, designated TSSC4 and TSSC6 (OMIM Ref. No. 603853), that were not imprinted in any of the fetal or extraembryonic tissues examined. The TSSC4 cDNA encodes a predicted protein of 349 amino acids that shows no close similarity to previously reported proteins. Northern blot analysis revealed that the TSSC4 gene was expressed as an approximately 1.6-kb transcript in fetal brain, lung, liver, and kidney. The TSSC4 and TSSC6 genes are both located in the center of the 1-Mb imprinted domain on 11p15 that contains the 7 imprinted genes. Thus, the imprinted gene domain of 11p15 appears to contain at least 2 imprinted subdomains, between which the TSSC4 and TSSC6 genes substantially escape imprinting, due either to a lack of initial silencing or to an early developmental relaxation of imprinting.

[44153] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44154] Lee, M. P.; Brandenburg, S.; Landes, G. M.; Adams, M.;

Miller, G.; Feinberg, A. P. : Two novel genes in the center of the 11p15 imprinted domain escape genomic imprinting. Hum. Molec. Genet. 8: 683–690, 1999. ; and

[44155] Lee, M. P.; Brandenburg, S.; Landes, G. M.; Adams, M.; Miller, G.; Feinberg, A. P. : Two novel genes in the center of the 11p15 imprinted domain escape genomic imprinting. Hum. Molec. Gene.

[44156] Further studies establishing the function and utilities of TSSC4 are found in John Hopkins OMIM database record ID 603852, and in cited publications numbered 491 and 7419 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726) is another VGAM1233 host target gene. ABCC13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC13 BINDING SITE, designated SEQ ID:28969, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44157] Another function of VGAM1233 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC13. Endothelial Differentiation, Sphingolipid G-protein-coupled Receptor, 1 (EDG1, Accession XM_001499) is another VGAM1233 host target gene. EDG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDG1 BINDING SITE, designated SEQ ID:29841, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44158] Another function of VGAM1233 is therefore inhibition of Endothelial Differentiation, Sphingolipid G-protein-coupled Receptor, 1 (EDG1, Accession XM_001499). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG1. FLJ12568 (Accession NM_024993) is another VGAM1233 host target gene.

FLJ12568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12568 BINDING SITE, designated SEQ ID:24551, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44159] Another function of VGAM1233 is therefore inhibition of FLJ12568 (Accession NM_024993). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12568. LENG1 (Accession XM_097304) is another VGAM1233 host target gene. LENG1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LENG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG1 BINDING SITE, designated SEQ ID:40860, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44160] Another function of VGAM1233 is therefore inhibition of LENG1 (Accession XM_097304). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG1. LIG-1 (Accession XM_033712) is another VGAM1233 host target gene. LIG-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIG-1 BINDING SITE, designated SEQ ID:31949, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44161] Another function of VGAM1233 is therefore inhibition of LIG-1 (Accession XM_033712). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG-1. MGC10999 (Accession NM_032307) is another VGAM1233 host target gene. MGC10999 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC10999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10999 BINDING SITE, designated SEQ ID:26087, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44162] Another function of VGAM1233 is therefore inhibition of MGC10999 (Accession NM_032307). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10999. MGC2603 (Accession NM_024037) is another VGAM1233 host target gene. MGC2603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2603 BINDING SITE, designated SEQ ID:23470, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44163] Another function of VGAM1233 is therefore inhibition of MGC2603 (Accession NM_024037). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2603. MGC3113 (Accession NM_024035) is another VGAM1233 host target gene. MGC3113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3113 BINDING SITE, designated SEQ ID:23467, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44164] Another function of VGAM1233 is therefore inhibition of MGC3113 (Accession NM_024035). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3113. SIMRP7 (Accession XM_166462) is another VGAM1233 host target gene. SIMRP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIMRP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated SEQ ID:44367, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA,

also designated SEQ ID:3944.

[44165] Another function of VGAM1233 is therefore inhibition of SIMRP7 (Accession XM_166462). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7. Testis Specific, 14 (TSGA14, Accession NM_018718) is another VGAM1233 host target gene. TSGA14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TSGA14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSGA14 BINDING SITE, designated SEQ ID:20792, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44166] Another function of VGAM1233 is therefore inhibition of Testis Specific, 14 (TSGA14, Accession NM_018718). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSGA14. LOC122416 (Accession XM_058615) is another VGAM1233 host target gene. LOC122416 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

LOC122416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122416 BINDING SITE, designated SEQ ID:36683, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44167] Another function of VGAM1233 is therefore inhibition of LOC122416 (Accession XM_058615). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122416. LOC145439 (Accession XM_085144) is another VGAM1233 host target gene. LOC145439 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145439 BINDING SITE, designated SEQ ID:37863, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44168] Another function of VGAM1233 is therefore inhibition of LOC145439 (Accession XM_085144). Accordingly, utilities

of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145439. LOC149842 (Accession XM_097745) is another VGAM1233 host target gene. LOC149842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149842 BINDING SITE, designated SEQ ID:41088, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44169] Another function of VGAM1233 is therefore inhibition of LOC149842 (Accession XM_097745). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149842. LOC153338 (Accession XM_098361) is another VGAM1233 host target gene. LOC153338 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC153338 BINDING SITE, designated SEQ ID:41606, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44170] Another function of VGAM1233 is therefore inhibition of LOC153338 (Accession XM_098361). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153338. LOC158654 (Accession XM_088632) is another VGAM1233 host target gene. LOC158654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158654 BINDING SITE, designated SEQ ID:39874, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44171] Another function of VGAM1233 is therefore inhibition of LOC158654 (Accession XM_088632). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158654. LOC162333 (Accession XM_102591) is another VGAM1233 host target gene. LOC162333 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42119, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44172] Another function of VGAM1233 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC254659 (Accession XM_170822) is another VGAM1233 host target gene. LOC254659 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254659 BINDING SITE, designated SEQ ID:45599, to the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, also designated SEQ ID:3944.

[44173] Another function of VGAM1233 is therefore inhibition of

LOC254659 (Accession XM_170822). Accordingly, utilities of VGAM1233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254659. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1234 (VGAM1234) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44174] VGAM1234 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1234 was detected is described hereinabove with reference to Figs. 1-8.

[44175] VGAM1234 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1234 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44176] VGAM1234 gene encodes a VGAM1234 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1234 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1234 precursor RNA is designated SEQ ID:1220, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1220 is located at position 11113 relative to the genome of Equine Herpesvirus 2.

- [44177] VGAM1234 precursor RNA folds onto itself, forming VGAM1234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44178] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1234 folded precursor RNA into VGAM1234 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide se-

quence of VGAM1234 RNA is designated SEQ ID:3945, and is provided hereinbelow with reference to the sequence listing part.

[44179] VGAM1234 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1234 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44180] VGAM1234 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1234 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1234 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44181] The complementary binding of VGAM1234 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1234 host target RNA into VGAM1234 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44182] It is appreciated that VGAM1234 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1234 host target genes. The mRNA of each one of this plurality of VGAM1234 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1234 RNA, herein designated VGAM RNA, and which when bound by VGAM1234 RNA causes inhibition of translation of respective one or more VGAM1234 host target proteins.

[44183] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1234 gene, herein designated VGAM GENE, on one or more VGAM1234 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44184] It is yet further appreciated that a function of VGAM1234

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1234 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1234 correlate with, and may be deduced from, the identity of the host target genes which VGAM1234 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44185] Nucleotide sequences of the VGAM1234 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1234 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1234 are further described hereinbelow with reference to Table 1.

[44186] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1234 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1234 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44187] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1234 gene, herein designated VGAM is inhibition of expression of VGAM1234 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1234 correlate with, and may be deduced from, the identity of the target genes which VGAM1234 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44188] Requiem, Apoptosis Response Zinc Finger Gene (REQ, Accession NM_006268) is a VGAM1234 host target gene. REQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by REQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REQ BINDING SITE, designated SEQ ID:12952, to the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, also designated SEQ ID:3945.

[44189] A function of VGAM1234 is therefore inhibition of Requiem, Apoptosis Response Zinc Finger Gene (REQ, Accession NM_006268), a gene which is a putative zinc finger that is required for apoptosis in murine myeloid cell lines. Accordingly, utilities of VGAM1234 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with REQ. The function of REQ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. CD109 (Accession NM_133493) is another VGAM1234 host target gene. CD109 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD109 BINDING SITE, designated SEQ ID:28570, to the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, also designated SEQ ID:3945.

[44190] Another function of VGAM1234 is therefore inhibition of CD109 (Accession NM_133493). Accordingly, utilities of VGAM1234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD109. Ras and Rab Interactor 3 (RIN3, Accession NM_024832) is another VGAM1234 host target gene. RIN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RIN3, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIN3 BINDING SITE, designated SEQ ID:24235, to the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, also designated SEQ ID:3945.

[44191] Another function of VGAM1234 is therefore inhibition of Ras and Rab Interactor 3 (RIN3, Accession NM_024832). Accordingly, utilities of VGAM1234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIN3. LOC113655 (Accession NM_138431) is another VGAM1234 host target gene. LOC113655 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC113655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113655 BINDING SITE, designated SEQ ID:28795, to the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, also designated SEQ ID:3945.

[44192] Another function of VGAM1234 is therefore inhibition of LOC113655 (Accession NM_138431). Accordingly, utilities

of VGAM1234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113655. LOC145501 (Accession XM_085157) is another VGAM1234 host target gene. LOC145501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145501 BINDING SITE, designated SEQ ID:37882, to the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, also designated SEQ ID:3945.

[44193] Another function of VGAM1234 is therefore inhibition of LOC145501 (Accession XM_085157). Accordingly, utilities of VGAM1234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145501. LOC148046 (Accession XM_097375) is another VGAM1234 host target gene. LOC148046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148046 BINDING SITE, designated SEQ ID:40866, to the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, also designated SEQ ID:3945.

[44194] Another function of VGAM1234 is therefore inhibition of LOC148046 (Accession XM_097375). Accordingly, utilities of VGAM1234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148046. LOC196985 (Accession XM_116968) is another VGAM1234 host target gene. LOC196985 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196985, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196985 BINDING SITE, designated SEQ ID:43158, to the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, also designated SEQ ID:3945.

[44195] Another function of VGAM1234 is therefore inhibition of LOC196985 (Accession XM_116968). Accordingly, utilities of VGAM1234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196985. LOC89919 (Accession XM_027244) is another VGAM1234 host target gene. LOC89919 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC89919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89919 BINDING SITE, designated SEQ ID:30464, to the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, also designated SEQ ID:3945.

[44196] Another function of VGAM1234 is therefore inhibition of LOC89919 (Accession XM_027244). Accordingly, utilities of VGAM1234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1235 (VGAM1235) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44197] VGAM1235 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1235 was detected is described hereinabove with reference to Figs. 1-8.

[44198] VGAM1235 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1235 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44199] VGAM1235 gene encodes a VGAM1235 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1235 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1235 precursor RNA is designated SEQ ID:1221, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1221 is located at position 102206 relative to the genome of Bovine Herpesvirus 4.

[44200] VGAM1235 precursor RNA folds onto itself, forming VGAM1235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[44201] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1235 folded precursor RNA into VGAM1235 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1235 RNA is designated SEQ ID:3946, and is provided hereinbelow with reference to the sequence listing part.

[44202] VGAM1235 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1235 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44203] VGAM1235 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1235 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1235 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1235 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44204] The complementary binding of VGAM1235 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1235 host target RNA into VGAM1235 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44205] It is appreciated that VGAM1235 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1235 host target genes. The mRNA of each one of this plurality of VGAM1235 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1235 RNA, herein designated VGAM RNA, and which when bound by VGAM1235 RNA causes inhibition of translation of respective one or more VGAM1235 host target proteins.

[44206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1235 gene, herein designated VGAM GENE, on one or more VGAM1235 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44207] It is yet further appreciated that a function of VGAM1235 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1235 correlate with, and may be deduced from, the identity of the host target genes which VGAM1235 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44208] Nucleotide sequences of the VGAM1235 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1235 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1235 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1235 are further described hereinbelow with reference to Table 1.

[44209] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1235 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1235 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44210] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1235 gene, herein designated VGAM is inhibition of expression of VGAM1235 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1235 correlate with, and may be deduced from, the identity of the target genes which VGAM1235 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44211] Adducin 2 (beta) (ADD2, Accession NM_017483) is a VGAM1235 host target gene. ADD2 BINDING SITE1 through ADD2 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADD2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of ADD2 BINDING SITE1 through ADD2 BINDING SITE4, designated SEQ ID:18935, SEQ ID:18940, SEQ ID:18943 and SEQ ID:18948 respectively, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44212] A function of VGAM1235 is therefore inhibition of Ad-
ducin 2 (beta) (ADD2, Accession NM_017483), a gene
which membrane-cytoskeleton- protein that promotes the
assembly of the spectrin-actin network. Accordingly, utili-
ties of VGAM1235 include diagnosis, prevention and
treatment of diseases and clinical conditions associated
with ADD2. The function of ADD2 and its association with
various diseases and clinical conditions, has been estab-
lished by previous studies, as described hereinabove with
reference to VGAM1185. Procollagen (type III) N-
endopeptidase (PCOLN3, Accession NM_002768) is an-
other VGAM1235 host target gene. PCOLN3 BINDING SITE
is HOST TARGET binding site found in the 3' untranslated
region of mRNA encoded by PCOLN3, corresponding to a
HOST TARGET binding site such as BINDING SITE I, BIND-
ING SITE II or BINDING SITE III. Table 2 illustrates the com-
plementarity of the nucleotide sequences of PCOLN3

BINDING SITE, designated SEQ ID:8662, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44213] Another function of VGAM1235 is therefore inhibition of Procollagen (type III) N-endopeptidase (PCOLN3, Accession NM_002768), a gene which is a member of the zincin superfamily of zinc-dependent metalloproteases. Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCOLN3. The function of PCOLN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM947. Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600) is another VGAM1235 host target gene. TCF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF3 BINDING SITE, designated SEQ ID:35009, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ

ID:3946.

[44214] Another function of VGAM1235 is therefore inhibition of Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600), a gene which plays major roles in determining tissue-specific cell fate during embryogenesis. Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF3. The function of TCF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. DKFZp547I224 (Accession NM_020221) is another VGAM1235 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21473, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44215] Another function of VGAM1235 is therefore inhibition of

DKFZp547I224 (Accession NM_020221). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. Fidgetin (FIGN, Accession NM_018086) is another VGAM1235 host target gene. FIGN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FIGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FIGN BINDING SITE, designated SEQ ID:19848, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44216] Another function of VGAM1235 is therefore inhibition of Fidgetin (FIGN, Accession NM_018086). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIGN. FLJ12891 (Accession NM_024950) is another VGAM1235 host target gene. FLJ12891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ12891 BINDING SITE, designated SEQ ID:24510, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44217] Another function of VGAM1235 is therefore inhibition of FLJ12891 (Accession NM_024950). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12891. FLJ22865 (Accession NM_025109) is another VGAM1235 host target gene. FLJ22865 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22865 BINDING SITE, designated SEQ ID:24758, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44218] Another function of VGAM1235 is therefore inhibition of FLJ22865 (Accession NM_025109). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22865. KIAA0295 (Accession XM_042833) is another

VGAM1235 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:33782, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44219] Another function of VGAM1235 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA1280 (Accession XM_045766) is another VGAM1235 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34554, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44220] Another function of VGAM1235 is therefore inhibition of KIAA1280 (Accession XM_045766). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. KIAA1987 (Accession XM_113870) is another VGAM1235 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42493, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44221] Another function of VGAM1235 is therefore inhibition of KIAA1987 (Accession XM_113870). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM1235 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12794, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44222] Another function of VGAM1235 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession XM_170929) is another VGAM1235 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4DIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:45708, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44223] Another function of VGAM1235 is therefore inhibition of

Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession XM_170929). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. PRO1496 (Accession NM_018603) is another VGAM1235 host target gene. PRO1496 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1496 BINDING SITE, designated SEQ ID:20680, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44224] Another function of VGAM1235 is therefore inhibition of PRO1496 (Accession NM_018603). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1496. LOC219920 (Accession XM_167787) is another VGAM1235 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44807, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44225] Another function of VGAM1235 is therefore inhibition of LOC219920 (Accession XM_167787). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC92568 (Accession XM_045852) is another VGAM1235 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34578, to the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, also designated SEQ ID:3946.

[44226] Another function of VGAM1235 is therefore inhibition of LOC92568 (Accession XM_045852). Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92568. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1236 (VGAM1236) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44227] VGAM1236 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1236 was detected is described hereinabove with reference to Figs. 1–8.

[44228] VGAM1236 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1236 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44229] VGAM1236 gene encodes a VGAM1236 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1236 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1236 precursor RNA is designated SEQ ID:1222, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1222 is located at position 104518 relative to the genome of Bovine Herpesvirus 4.

- [44230] VGAM1236 precursor RNA folds onto itself, forming VGAM1236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44231] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1236 folded precursor RNA into VGAM1236 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1236 RNA is designated SEQ ID:3947, and is provided hereinbelow with reference to the sequence listing part.

[44232] VGAM1236 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1236 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44233] VGAM1236 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1236 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1236 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44234] The complementary binding of VGAM1236 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1236 host target RNA into VGAM1236 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44235] It is appreciated that VGAM1236 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1236 host target genes. The mRNA of each one of this plurality of VGAM1236 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1236 RNA, herein designated VGAM RNA, and which when bound by VGAM1236 RNA causes

inhibition of translation of respective one or more VGAM1236 host target proteins.

[44236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1236 gene, herein designated VGAM GENE, on one or more VGAM1236 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44237] It is yet further appreciated that a function of VGAM1236 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1236 include diagnosis, prevention and

treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1236 correlate with, and may be deduced from, the identity of the host target genes which VGAM1236 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44238] Nucleotide sequences of the VGAM1236 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1236 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1236 are further described hereinbelow with reference to Table 1.

[44239] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1236 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1236 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44240] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1236 gene, herein designated VGAM is inhibition of expression of VGAM1236 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1236 correlate with, and may be deduced from, the identity of the target genes which VGAM1236 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44241] Sex Comb On Midleg-like 2 (Drosophila) (SCML2, Accession NM_006089) is a VGAM1236 host target gene. SCML2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCML2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCML2 BINDING SITE, designated SEQ ID:12735, to the nucleotide sequence of VGAM1236 RNA, herein designated VGAM RNA, also designated SEQ ID:3947.

[44242] A function of VGAM1236 is therefore inhibition of Sex Comb On Midleg-like 2 (Drosophila) (SCML2, Accession NM_006089). Accordingly, utilities of VGAM1236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML2. TRAM (Accession NM_014294) is another VGAM1236 host target gene. TRAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAM,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAM BINDING SITE, designated SEQ ID:15591, to the nucleotide sequence of VGAM1236 RNA, herein designated VGAM RNA, also designated SEQ ID:3947.

[44243] Another function of VGAM1236 is therefore inhibition of TRAM (Accession NM_014294). Accordingly, utilities of VGAM1236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAM. KIAA0831 (Accession NM_014924) is another VGAM1236 host target gene. KIAA0831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:17206, to the nucleotide sequence of VGAM1236 RNA, herein designated VGAM RNA, also designated SEQ ID:3947.

[44244] Another function of VGAM1236 is therefore inhibition of KIAA0831 (Accession NM_014924). Accordingly, utilities of VGAM1236 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0831. KIAA1300 (Accession XM_031744) is another VGAM1236 host target gene. KIAA1300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1300 BINDING SITE, designated SEQ ID:31480, to the nucleotide sequence of VGAM1236 RNA, herein designated VGAM RNA, also designated SEQ ID:3947.

[44245] Another function of VGAM1236 is therefore inhibition of KIAA1300 (Accession XM_031744). Accordingly, utilities of VGAM1236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1300. LOC130813 (Accession XM_065904) is another VGAM1236 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37306, to

the nucleotide sequence of VGAM1236 RNA, herein designated VGAM RNA, also designated SEQ ID:3947.

[44246] Another function of VGAM1236 is therefore inhibition of LOC130813 (Accession XM_065904). Accordingly, utilities of VGAM1236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1237 (VGAM1237) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44247] VGAM1237 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1237 was detected is described hereinabove with reference to Figs. 1–8.

[44248] VGAM1237 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1237 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44249] VGAM1237 gene encodes a VGAM1237 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1237 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1237 precursor RNA is designated SEQ ID:1223, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1223 is located at position 100957 relative to the genome of Bovine Herpesvirus 4.

[44250] VGAM1237 precursor RNA folds onto itself, forming VGAM1237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44251] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1237 folded precursor RNA into VGAM1237 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1237 RNA is designated SEQ ID:3948, and is provided hereinbelow with reference to the sequence listing part.

[44252] VGAM1237 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1237 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44253] VGAM1237 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1237 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1237 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44254] The complementary binding of VGAM1237 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1237 host target RNA into VGAM1237 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44255] It is appreciated that VGAM1237 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1237 host target genes. The mRNA of each one of this plurality of VGAM1237 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1237 RNA, herein designated VGAM RNA, and which when bound by VGAM1237 RNA causes inhibition of translation of respective one or more VGAM1237 host target proteins.

[44256] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1237 gene, herein designated VGAM GENE, on one or more VGAM1237 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[44257] It is yet further appreciated that a function of VGAM1237 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1237 correlate with, and may be deduced from, the identity of the host target genes which VGAM1237 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44258] Nucleotide sequences of the VGAM1237 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1237 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1237 are further described hereinbelow with reference to Table 1.

[44259] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1237 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1237 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44260] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1237 gene, herein designated VGAM is inhibition of expression of VGAM1237 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1237 correlate with, and may be deduced from, the identity of the target genes which VGAM1237 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44261] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093) is a VGAM1237 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11551, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44262] A function of VGAM1237 is therefore inhibition of Core-

binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. RAB5B, Member RAS Oncogene Family (RAB5B, Accession NM_002868) is another VGAM1237 host target gene. RAB5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB5B BINDING SITE, designated SEQ ID:8773, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44263] Another function of VGAM1237 is therefore inhibition of RAB5B, Member RAS Oncogene Family (RAB5B, Accession NM_002868), a gene which is presumably involved in vesicular trafficking at the plasma membrane. Accord-

ingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB5B. The function of RAB5B has been established by previous studies. A number of processes in eukaryotic cells are believed to be regulated by small, monomeric GTPases belonging to the RAS superfamily. A subset of these GTPases (the yeast YPT1/SEC4 gene products and their mammalian counterparts, the RAB proteins) plays a central role in membrane trafficking. Each of the several proteins of this subfamily that have been identified is thought to regulate vesicular trafficking at a specific subcellular compartment. The subcellular location of several RAB proteins has been determined by immunohistochemical methods. For example, RAB2 (OMIM Ref. No. 179509) is found in the intermediate recycling pathway between the endoplasmic reticulum and the Golgi complex. RAB6 (OMIM Ref. No. 179513) is distributed in the medial and trans Golgi. RAB4 (OMIM Ref. No. 179511) and RAB5A (OMIM Ref. No. 179512) are associated with the plasma membrane and early endosomes. Wilson and Wilson (1992) cloned cDNA of a novel member of the RAB family by screening a human umbilical vein endothelial cell cDNA library with oligonucleotide probes correspond-

ing to a region conserved in all RAB proteins. The newly identified RAB protein was 81% identical to human RAB5, the canine counterpart of which had been localized to the plasma membrane and early endosomes. In light of this homology, Wilson and Wilson (1992) called the new member of the GTPase superfamily RAB5B. It is presumably involved in vesicular trafficking at the plasma membrane. By fluorescence in situ hybridization, Korenberg et al. (1995) mapped the RAB5B gene to 12q13.

[44264] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44265] Korenberg, J. R.; Chen, X.-N.; Adams, M. D.; Venter, J. C. : Toward a cDNA map of the human genome. *Genomics* 29: 364–370, 1995. ; and

[44266] Wilson, D. B.; Wilson, M. P. : Identification and subcellular localization of human rab5b, a new member of the ras-related superfamily of GTPases. *J. Clin. Invest.* 89: 996–1005, 1992.

[44267] Further studies establishing the function and utilities of RAB5B are found in John Hopkins OMIM database record ID 179514, and in cited publications numbered 2545–2546 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM_015385) is another VGAM1237 host target gene. SORBS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SORBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORBS1 BINDING SITE, designated SEQ ID:17688, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44268] Another function of VGAM1237 is therefore inhibition of Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM_015385), a gene which necessary for cell polarization during vegetative growth. Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORBS1. The function of SORBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. Chromosome 20 Open Reading Frame 18 (C20orf18, Accession NM_031228) is another

VGAM1237 host target gene. C20orf18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf18 BINDING SITE, designated SEQ ID:25274, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44269] Another function of VGAM1237 is therefore inhibition of Chromosome 20 Open Reading Frame 18 (C20orf18, Accession NM_031228). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf18. Chromosome 20 Open Reading Frame 30 (C20orf30, Accession NM_014145) is another VGAM1237 host target gene. C20orf30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf30 BINDING SITE, designated SEQ ID:15430, to the nucleotide sequence of VGAM1237 RNA,

herein designated VGAM RNA, also designated SEQ ID:3948.

[44270] Another function of VGAM1237 is therefore inhibition of Chromosome 20 Open Reading Frame 30 (C20orf30, Accession NM_014145). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf30.

FLJ13612 (Accession NM_025202) is another VGAM1237 host target gene. FLJ13612 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13612 BINDING SITE, designated SEQ ID:24864, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44271] Another function of VGAM1237 is therefore inhibition of FLJ13612 (Accession NM_025202). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13612. Growth Hormone Inducible Transmembrane Protein (GHITM, Accession NM_014394) is another

VGAM1237 host target gene. GHITM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GHITM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GHITM BINDING SITE, designated SEQ ID:15726, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44272] Another function of VGAM1237 is therefore inhibition of Growth Hormone Inducible Transmembrane Protein (GHITM, Accession NM_014394). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHITM. KIAA0700 (Accession XM_050561) is another VGAM1237 host target gene. KIAA0700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0700 BINDING SITE, designated SEQ ID:35660, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3948.

[44273] Another function of VGAM1237 is therefore inhibition of KIAA0700 (Accession XM_050561). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0700. KIAA1877 (Accession XM_038616) is another VGAM1237 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32884, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44274] Another function of VGAM1237 is therefore inhibition of KIAA1877 (Accession XM_038616). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM1237 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16394, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44275] Another function of VGAM1237 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. SPEC1 (Accession NM_020239) is another VGAM1237 host target gene. SPEC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:21512, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44276] Another function of VGAM1237 is therefore inhibition of

SPEC1 (Accession NM_020239). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1. LOC143425 (Accession XM_113695) is another VGAM1237 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42348, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44277] Another function of VGAM1237 is therefore inhibition of LOC143425 (Accession XM_113695). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. LOC149832 (Accession XM_097733) is another VGAM1237 host target gene. LOC149832 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC149832 BINDING SITE, designated SEQ ID:41082, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44278] Another function of VGAM1237 is therefore inhibition of LOC149832 (Accession XM_097733). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149832. LOC150319 (Accession XM_086816) is another VGAM1237 host target gene. LOC150319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150319 BINDING SITE, designated SEQ ID:38895, to the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, also designated SEQ ID:3948.

[44279] Another function of VGAM1237 is therefore inhibition of LOC150319 (Accession XM_086816). Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150319. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1238 (VGAM1238) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44280] VGAM1238 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1238 was detected is described hereinabove with reference to Figs. 1–8.

[44281] VGAM1238 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1238 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44282] VGAM1238 gene encodes a VGAM1238 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1238 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1238 precursor RNA is designated SEQ ID:1224, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1224 is located at position 105956 relative to the genome of Bovine Herpesvirus 4.

[44283] VGAM1238 precursor RNA folds onto itself, forming VGAM1238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44284] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1238 folded precursor RNA into VGAM1238 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1238 RNA is designated SEQ ID:3949, and is provided hereinbelow with reference to the sequence listing part.

[44285] VGAM1238 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1238 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44286] VGAM1238 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1238 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1238 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1238 host target RNA,
